

- 1543
Nicolaus Copernicus
 - publishes heliocentric universe in *De Revolutionibus Orbium Coelestium*
 - implicit introduction Copernican principle: Earth/Sun is not special
- 1609-1632
Galileo Galilei
 - by means of (telescopic) observations, proves the validity of the heliocentric Universe.
- 1609/1619
Johannes Kepler
 - the 3 Kepler laws, describing the elliptical orbits of the planets around the Sun
- 1687
Isaac Newton
 - discovers Gravitational Force as agent behind cosmic motions
 - publishes his *Principia* (*Philosophiae Naturalis Principia Mathematica*), which establishes the natural laws of motion and gravity (the latter only to be replaced by Einstein's theory of GR)
- 1755
Immanuel Kant
 - asserts that nebulae are really galaxies separate from and outside from the Milky Way,
 - calling these Island Universes
- 1785
William Herschel
 - proposes theory that our Sun is at or near the center of our Galaxy (Milky Way)

Nicolaus Copernicus

Birthhouse
Copernicus,
Torun

- 1473 - born in Torun (Poland)
- 1491-1495 - study Univ. Krakow
- 1496-1501 - 3 years Univ. Bologna - canon law
- 1503- - Warmia
- 1514 - Frombork

Languages: Latin, German

1514 - Commentariolus

Nicolai Copernici de hypothesibus motuum coelestium a se constitutis commentariolus

- + theoretical treatise on heliocentric mechanism
- + 40 pages, 7 basic assumptions

Tower (living) Copernicus, Frombork

Frombork Cathedral

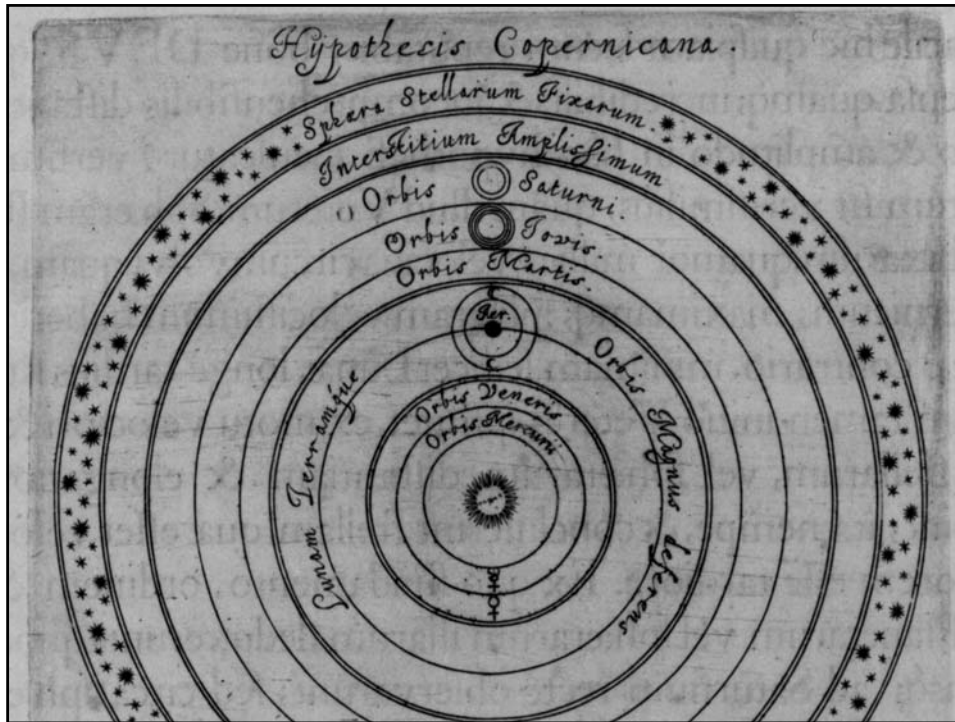

Commentariolus

1. There is no one center of all the celestial circles or spheres.
2. The center of the earth is not the center of the universe, but only of gravity and of the lunar sphere.
3. All the spheres revolve about the sun as their midpoint, and therefore the sun is the center of the universe.
4. The ratio of the earth's distance from the sun to the height of the firmament (outermost celestial sphere containing the stars) is so much smaller than the ratio of the earth's radius to its distance from the sun that the distance from the earth to the sun is imperceptible in comparison with the height of the firmament.
5. Whatever motion appears in the firmament arises not from any motion of the firmament, but from the earth's motion. The earth together with its circumjacent elements performs a complete rotation on its fixed poles in a daily motion, while the firmament and highest heaven abide unchanged.
6. What appear to us as motions of the sun arise not from its motion but from the motion of the earth and our sphere, with which we revolve about the sun like any other planet. The earth has, then, more than one motion.
7. The apparent retrograde and direct motion of the planets arises not from their motion but from the earth's. The motion of the earth alone, therefore, suffices to explain so many apparent inequalities in the heavens.

De Revolutionibus

Orbium Coelestium

Nicolaus Copernicus

1543 - publication
De Revolutionibus Orbium Coelestium
 (On the Revolution of the Celestial Spheres)

1514 - **Commentariolus (Little Commentary)**
 1532 - finished work on Revolutionibus

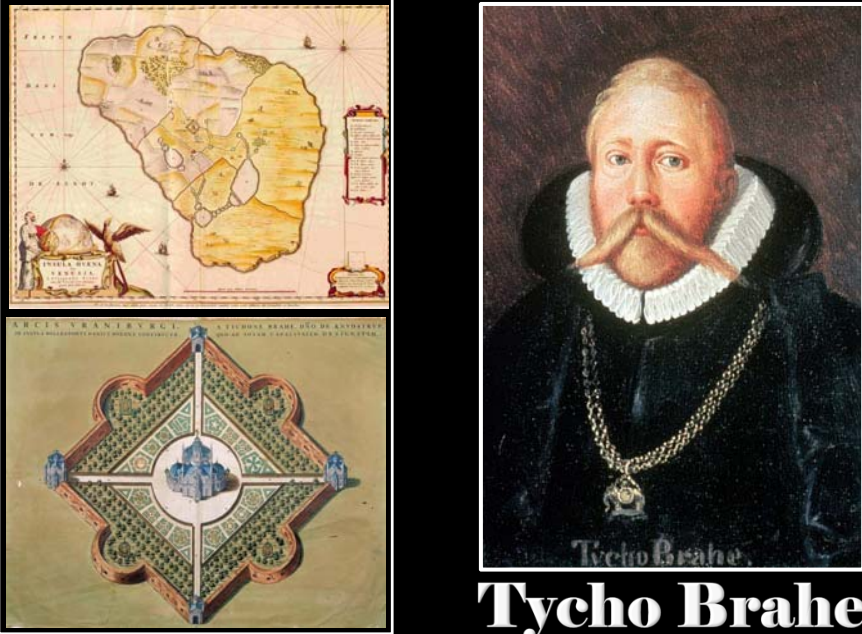

1543 - publication pushed and processed
 by George Joachim Rheticus
 (mathematician Wittenberg)

- printed by
 Johannes Petreius, Nuremberg

May 24, 1543 - death Copernicus
 - legend: presentation last
 pages printed Revolutionibus

Note:
 Copernicus cited Aristarchus of Samos in an early
 (unpublished) manuscript of De Revolutionibus (which
 still survives), though he removed the reference from
 his final published manuscript.

**Observatory Uraniborg
on island Hven (nowadays between Sweden-Denmark)**

**Tycho Brahe
(1546-1601)**

Tycho Brahe (1546-1601)

- Danish nobleman astronomer, astrologer, alchemist
- Observatory Uraniborg on island Hven
- Hven was his fiefdom
- entire island Hven devoted to exploitation for observatory
- Brahe famous for high + accuracy + quantity astronomical and planetary observations - before telescope
- Key to Scientific Revolution

Quadrant
Achieved Accuracy ~1'-2'

Uraniborg

Uraniborg

- Island Hven given to Tycho by Danish king Frederik II
- 1576: building of Uraniborg
- 1581: building of annex, Stjerneborg
- cellar Uraniborg: alchemy experiments
- 1576-1597 ~ 100 students & assistants
- research community in Research Center & Institution of Education

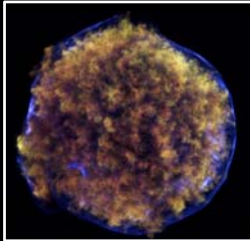

De Nova Stella (1572)

End of the Aristotelean cosmological view that
- the world beyond the Moon is eternally unchanging

- 11 Nov. 1572 Tycho observed a new star
- Constellation Cassiopeia
- At hindsight it has been 1 of the 5 visible supernovae that have exploded in the Galaxy over the past 1000 years
- distance: 7500 lightyears
- Tycho published this in De Nova Stella

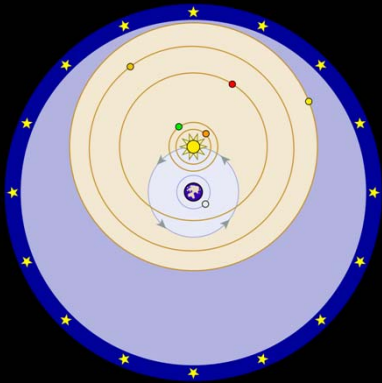

Supernova remnant
SN1572
Tycho's SNR (1572)
Exploding star

Geo-Heliocentric Model

Tycho did not accept the heliocentric view of Copernicus:

- Observational data in 16th century were not good enough to prove it.
- Completely eliminated the ancient (Aristotelean) idea of heavenly spheres
- "Earth is a lazy body":

"such a fast motion could not belong to the earth, a body very heavy and dense and opaque, but rather belongs to the sky itself whose form and subtle and constant matter are better suited to a perpetual motion, however fast"

Brahe & Kepler

Arguably, the most significant step in Tycho's career:

- move to the German imperial court in Prague (following tensions with new Danish king Christian IV)
- meeting up with (young) Johannes Kepler

The analytical genius of Kepler gained access to the state of the art accurate observations of Tycho Brahe, opening up the path towards unravelling the laws of motion in the solar system.

Mysterium Cosmographicum

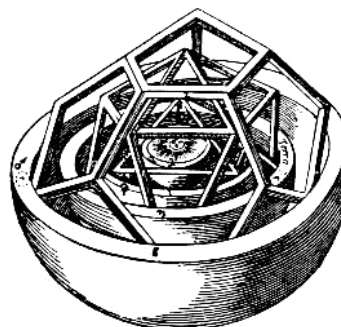

Prodromus dissertationum cosmographicarum, continens mysterium cosmographicum, de admirabili proportione orbium coelestium, de que causis coelorum numeri, magnitudinis, motuumque periodicorum genuinis & proprijs, demonstratum, per quinque regularia corpora geometrica

Forerunner of the Cosmological Essays, Which Contains the Secret of the Universe; on the Marvelous Proportion of the Celestial Spheres, and on the True and Particular Causes of the Number, Magnitude, and Periodic Motions of the Heavens; Established by Means of the Five Regular Geometric Solids

Mysterium Cosmographicum

- First published defense Copernican system
- Published 1596
- Book explains Kepler's cosmological theory, based on the Copernican system
- Five Pythagorean regular polyhedra dictate the structure of the universe and reflect God's plan through geometry.
- Kepler found that each of the five Platonic solids could be uniquely inscribed and circumscribed by spherical orbs;
- nesting these solids, each encased in a sphere, within one another would produce six layers, corresponding to the six known planets
- **Mercury, Venus, Earth, Mars, Jupiter, and Saturn.**
- By ordering the solids correctly
- **octahedron, icosahedron, dodecahedron, tetrahedron, cube**

Kepler found that the spheres could be placed at intervals corresponding (within the accuracy limits of available astronomical observations) to the relative sizes of each planet's path, assuming the planets circle the Sun

Mysterium Cosmographicum

Kepler thought he had revealed

God's geometrical plan for the universe.

Much of Kepler's enthusiasm for the Copernican system stemmed from his theological convictions about the connection between the physical and the spiritual.

The universe itself was an image of God,

- His first manuscript of *Mysterium* contained an extensive chapter reconciling heliocentrism with biblical passages that seemed to support geocentrism.¹
- Kepler never relinquished the Platonist polyhedral-spherist cosmology of *Mysterium Cosmographicum*.
- His subsequent main astronomical works were in some sense only further developments of it,

Mysterium Cosmographicum

Modern astronomy owes much to

Mysterium Cosmographicum

- Despite flaws in its main thesis, "since it represents the first step in cleansing the Copernican system of the remnants of the Ptolemaic theory still clinging to it." (Dryer)
- Especially when dealing with the geometry of the universe, Kepler consistently utilizes Platonic and Neo-Platonic frameworks of thought.
- The entirety of the polyhedral idea is based on the same "formal cause" postulated by Plato for the structure of the universe.
- In an argument from design, Kepler postulates the existence and necessity of God the Creator as this "efficient cause"

Astronomia Nova

Full title:

Astronomia Nova AITIOAOIHTOΣ seu physica coelestis, tradita commentariis de motibus stellae Martis ex observationibus G.V. Tychonis Brahe

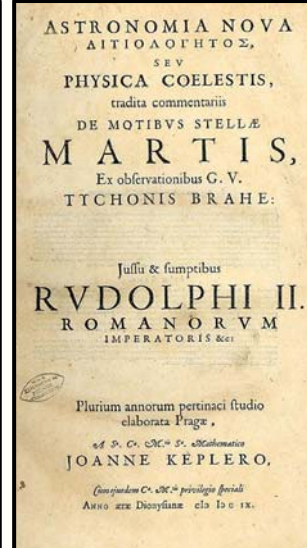

Published 1609

One of the most important works of the Scientific Revolution

Reports Kepler's 10 year long investigation of motion of planet Mars.

In addition to providing strong arguments heliocentrism, it describes the motion of planets, incl. elliptical shape of orbits

- first 2 laws of Kepler

Kepler Laws

Kepler laws of planetary motion

1. The orbit of a planet is an ellipse with the Sun at one of the two foci.
2. A line segment joining a planet and the Sun sweeps out equal areas during equal intervals of time.
3. The square of the orbital period of a planet is proportional to the cube of the semi-major axis of its orbit.

Huygens & Saturn

Cosmotheoros

1695-1698:

- Speculation on the existence of extraterrestrial life
- Identification (liquid) water as main condition for the emergence of life
- Method for estimating distances

Galileo Galilei

(1564-1642)

DIALOGO DI GALILEO GALILEI LINCEO MATEMATICO SOPRAORDINARIO DELLO STUDIO DI PISA. *E Filosofo, e Matematico primario del* SERENISSIMO GR.DVCA DI TOSCANA.

Due ne i congressi di quattro giornate si discorre
sopra i due

MASSIMI SISTEMI DEL MONDO
TOLEMAICO, E COPERNICANO;
