&

Cosmic Expansion History

Friedmann & Lemaitre

Alexander Friedmann George Lemaitre

(1888 -1925) (1894-1966)

They discovered (independently) theoretically the expansion of the Universe as a solution to the Theory of General Relativity.

... and derived the equations that describe the expansion and evolution of the universe,

the foundation for all of modern Cosmology:

Friedmann-Lemaitre Equation

Evolving Universe

- Einstein, de Sitter, Friedmann and Lemaitre all realized that in General Relativity, there cannot be a stable and static Universe:
- The Universe either expands, or it contracts ...
- Expansion Universe encapsulated in a

GLOBAL expansion factor a(t)

• All distances/dimensions of objects uniformly increase by a(t):

at time t, the distance between two objects i and j has increased to

$$\vec{r}_i - \vec{r}_j = a(t) \left(\vec{r}_{i,0} - \vec{r}_{j,0} \right)$$

Note: by definition we chose a(t_o)=1,
i.e. the present-day expansion factor

Evolution & Fate Friedmann-Robertson-Walker-Lemaitre Universe

Completely determined by 3 factors:

• energy and matter content (density and pressure)

• geometry of the Universe (curvature)

• Cosmological Constant

Friedmann-Robertson-Walker-Lemaitre Universe

Friedmann-Robertson-Walker-Lemaitre Universe

Because of General Relativity, the evolution of the Universe is determined by four factors:

- density $\rho(t)$
- pressure
- curvature

• Curvature:

p(t)

 kc^2 / R_0^2 k = 0, +1, -1

 R_{0} : present curvature radius

• cosmological constant Λ

- in relativity, energy & momentum need to be • Density & Pressure: seen as one physical quantity (four-vector) - pressure = momentum flux - gravity is a manifestation of geometry spacetime

- Cosmological Constant: - free parameter in General Relativity
 - Einstein's "biggest blunder"
 - mysteriously, since 1998 we know it dominates the Universe

FRW Dynamics

In a FRW Universe, densities are in the order of the critical density, the density at which the Universe has a flat curvature

$$\rho_{crit} = \frac{3H_0^2}{8\pi G} = 1.8791h^2 \times 10^{-29} g \, cm^{-3}$$

$$\rho_0 = 1.8791 \times 10^{-29} \,\Omega h^2 \ g \ cm^{-3}$$
$$= 2.78 \times 10^{11} \,\Omega h^2 \qquad M_{\odot} Mpc^{-3}$$

FRW Dynamics

In a matter-dominated Universe, the evolution and fate of the Universe entirely determined by the (energy) density in units of critical density:

Arguably, ☐ is the most important parameter of cosmology !!!

Present-day Cosmic Density:

$$\rho_0 = 1.8791 \times 10^{-29} \,\Omega h^2 \,g \,cm^{-3}$$
$$= 2.78 \times 10^{11} \,\Omega h^2 \qquad M_{\odot} Mpc^{-3}$$

Cosmic tug of war

The force of dark energy surpasses that of dark matter as time progresses.

Age of the Universe

Hubble Time

• The repercussions of Hubble's discovery are truly tremendous:

the inescapable conclusion is that the universe has a finite age !

• Just by simple extrapolation back in time we find that at some instant the objects will have touched upon each other, i.e. r(t_H)=0. If we assume for simplicity that the expansion rate did remain constant (which it did not !), we find a direct measure for the age of the universe, the

The Hubble parameter is usually stated in units of km/s/Mpc.

It's customary to express it in units of 100 km/s/Mpc, expressing the real value in terms of

the dimensionless value h=H_o/[100 km/s/Mpc].

The best current estimate is $H_0=72 \text{ km/s/Mpc}$. This sets $t_0 \sim 10 \text{ Gyr}$.

Hubble Parameter

For a long time, the correct value of the Hubble constant H_o
was a major unsettled issue:

 $H_0 = 50 \text{ km s}^{-1} \text{ Mpc}^{-1} \longrightarrow H_0 = 100 \text{ km s}^{-1} \text{ Mpc}^{-1}$

- This meant distances and timescales in the Universe had to deal with uncertainties of a factor 2 !!!
- Following major programs, such as Hubble Key Project, the Supernova key projects and the WMAP CMB measurements,

$$H_0 = 71.9^{+2.6}_{-2.7} \, km \, s^{-1} Mpc^{-1}$$

Cosmic Curvature

How Much ?

Cosmic Curvature

Cosmic Microwave Background

Map of the Universe at Recombination Epoch (Planck, 2013):
☑ 379,000 years after Big Bang
☑ Subhorizon perturbations: primordial sound waves
☑ △T/T < 10-5

Measuring Curvature

Measuring the Geometry of the Universe:

- Object with known physical size, at large cosmological distance
- Measure angular extent on sky
- Comparison yields light path, and from this the curvature of space

Measuring Curvature

- Object with known physical size, at large cosmological distance:
- Sound Waves in the Early Universe !!!!

Fluctuations-Origin

Music of the Spheres

- small ripples in primordial matter & photon distribution
- gravity:
 - compression primordial photon gas
 - photon pressure resists
- compressions and rarefactions in photon gas: sound waves
- sound waves not heard, but seen: - compressions: (photon) T higher
 - lower
 - rarefactions:
- fundamental mode sound spectrum
 - size of "instrument":
 - (sound) horizon size last scattering
- Observed, angular size: θ~1°
 - exact scale maximum compression, the "cosmic fundamental mode of music" W. Hu

Cosmic Microwave Background

COBE measured fluctuations:> 7°Size Horizon at Recombination spans angle~ 1°

Flat universe from CMB

• First peak: flat universe

Flat:

appear as big

as they are

Open: spots appear smaller

We know the redshift and the time it took for the light to reach us:

from this we know the

- length of the legs of the triangle
- the angle at which we are measuring the sound horizon.

$$v \approx \frac{c}{\sqrt{3}}$$

$$\ell \approx 200/\sqrt{1-\Omega_k}$$

Closed: hot spots appear larger

The Cosmic Tonal Ladder

The Cosmic Microwave Background Temperature Anisotropies: Universe is almost perfectly FLAT !!!!

Cosmic Horizons

Cosmic Horizons

Fundamental Concept for our understanding of the physics of the Universe:

- Physical processes are limited to the region of space with which we are or have ever been in physical contact.
- What is the region of space with which we are in contact ? Region with whom we have been able to exchange photons (photons: fastest moving particles)
- From which distance have we received light.
- Complication: light is moving in an expanding and curved space
 fighting its way against an expanding background

• This is called the

Horizon of the Universe

Horizon of the Universe: distance that light travelled since the Big Bang

EXPANDING UNIVERSE, SHRINKING VIEW

The universe may be infinite, but consider what happens to the patch of space around us (*purple sphere*), of which we see only a part (*yellow inner sphere*). As space expands, galaxies (*orange spots*) spread out. As light has time to propagate, we observers on Earth (or our predecessors or descendants) can see a steadily increasing volume of space. About six billion years ago, the expansion began to accelerate, carrying distant galaxies away from us faster than light.

Observable region Galaxy Galaxy Region of space At the onset of acceleration, we see the largest number of galaxies that we ever will.

NOTE:

Because space is expanding uniformly, alien beings in other galaxies see this same pattern. 2 The visible region grows, but the overall universe grows even faster, so we actually see a smaller fraction of what is out there.

3 Distant galaxies (those not bound to us by gravity) move out of our range of view. Meanwhile, gravity pulls nearby galaxies together.

Cosmic Future

Cosmic Fate

100 Gigayears: the end of Cosmology

The night sky on Earth (assuming it survives) will change dramatically as our Milky Way galaxy merges with its neighbors and distant galaxies recede beyond view.

DIFFUSE BAND stretching across the sky is the disk of the Milky Way. A few nearby galaxies, such as Andromeda and the Magellanic Clouds, are visible to the naked eye. Telescopes reveal billions more.

ANDROMEDA has been moving toward us and now nearly fills the sky. The sun swells to red giant size and subsequently burns out, consigning Earth to a bleak existence.

sUCCESSOR to the Milky Way is a ball-like supergalaxy, and Earth may float forlornly through its distant outskirts. Other galaxies have disappeared from view. LIGHTS OUT: The last stars burn out. Apart from dimly glowing black holes and any artificial lighting that civilizations have rigged up, the universe goes black. The galaxy later collapses into a black hole.
