from Cosmic Birth to Cosmic Web

Dark Matter

Matter

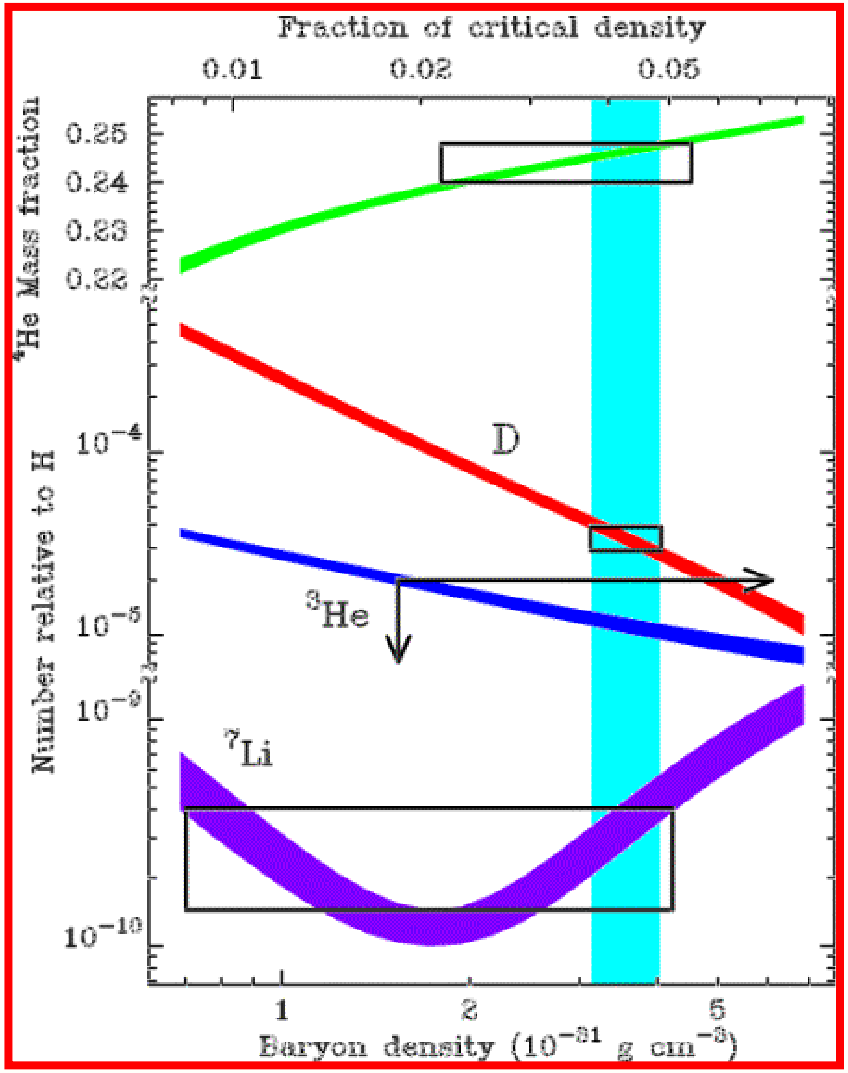
- Baryonic Matter
- Nonbaryonic Dark Matter

Baryonic Matter

The amount of baryonic matter in the Universe is (by now) very well determined, by two independent determinations:

1) Primordial Nucleosynthesis
2) Acoustic Oscillations in CMB power spectrum, 2nd peak (CMB)

Baryonic Matter: primordial nucleosynthesis

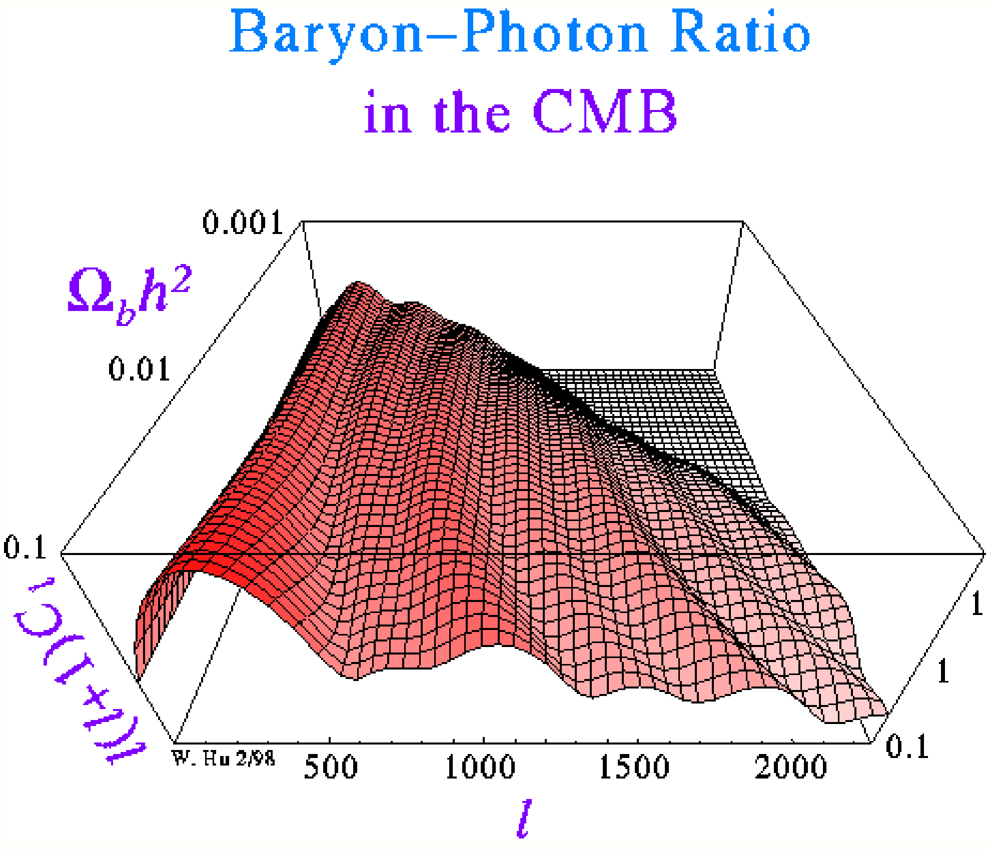


From measured light element abundances:

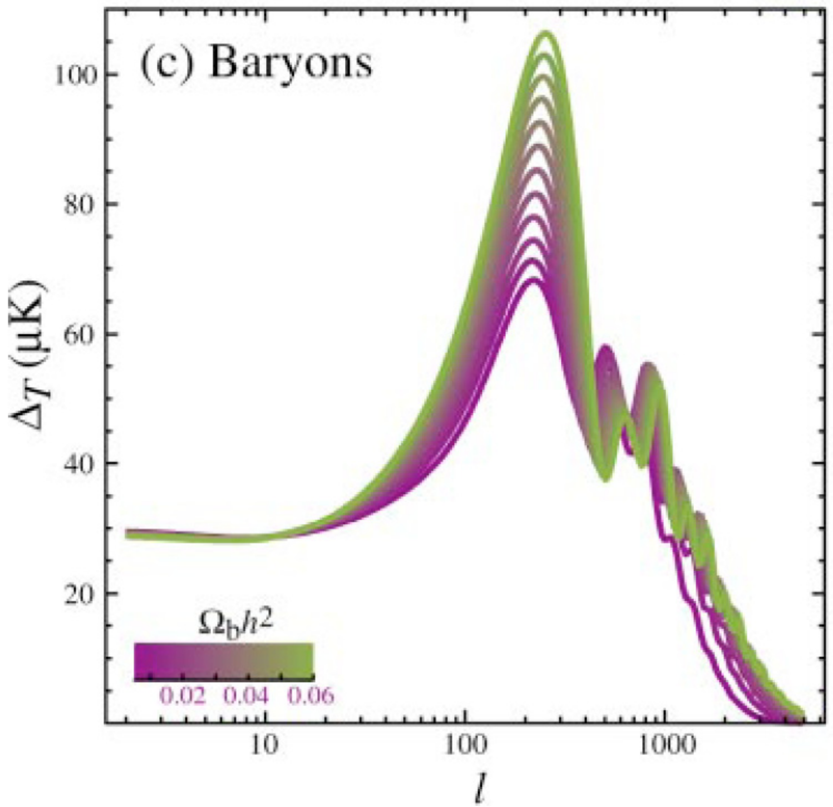
$$\eta \equiv \frac{n_B}{n_\gamma}$$

$$0.005 \lesssim \Omega_b h^2 \lesssim 0.026$$

Baryonic Matter: CMB



Due to baryon drag in the primordial baryon-photon gas, 2nd peak in CMB spectrum is suppressed:



$$\Omega_b h^2 \approx 0.0224 \pm 0.0009$$
$$\Omega_b \approx 0.044 \pm 0.004$$

Baryonic Matter

MACHOs: Massive astrophysical compact halo object

Modified Gravity: modification of General Relativity

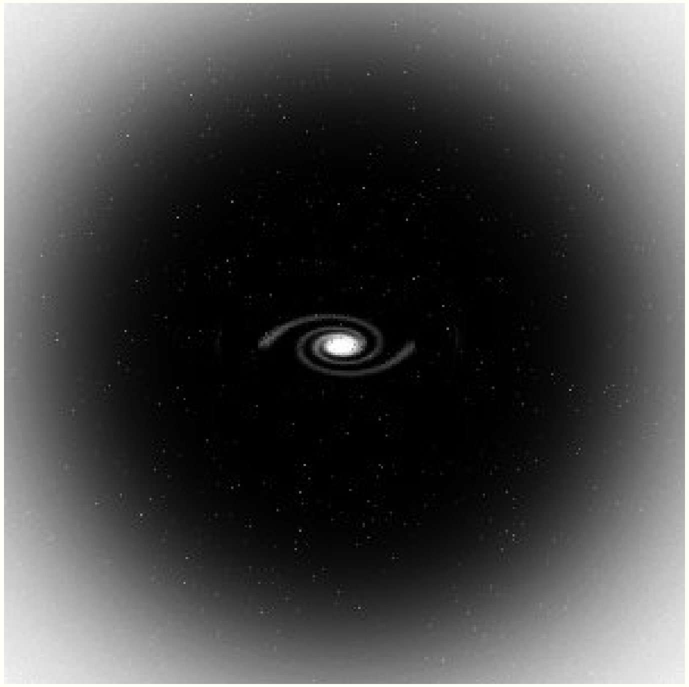
SIMPs ... Strongly Interacting Massive Particles

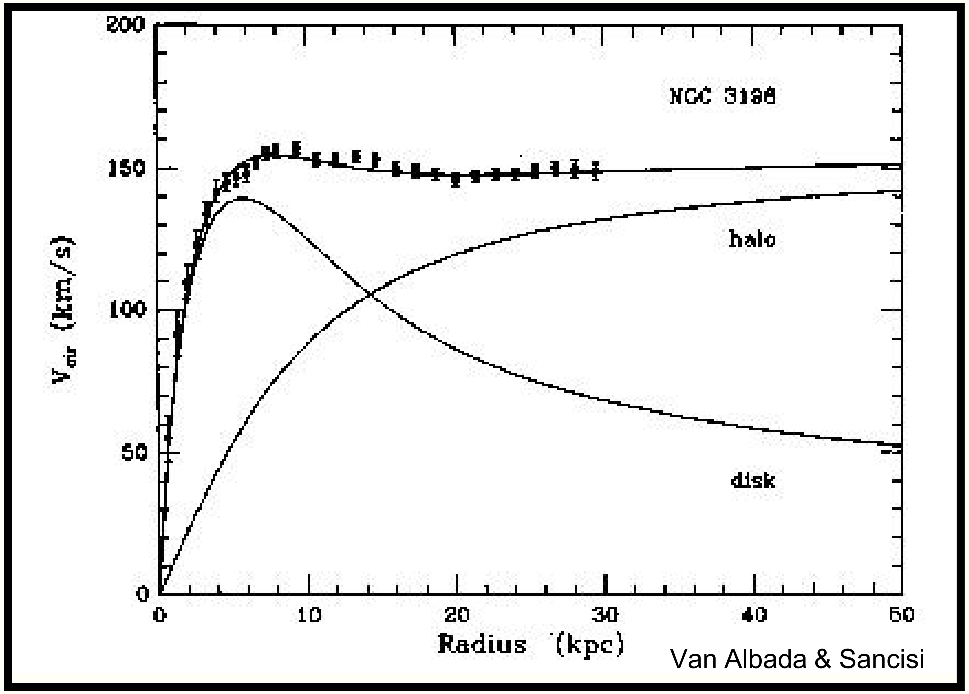
Dark Matter: disk galaxies

- The dark matter in these galactic dark halos will keep the stars and gas clouds in the outer reaches of the spiral galaxies swirling around the galaxy with such high velocities.

$$GM(r)/r \quad = \quad v_c^2$$

- Moreover, the dark matter halos would provide a natural stabilization of the thin and fragile rotating spiral discs, which otherwise are rather unstable structures which would easily be disrupted by "perturbative vibrations".





Clusters of Galaxies: X-ray intracluster gas

Baryonic matter in clusters is not only confined to galaxies:

~ 2 to 5 times more baryonic mass in the form of a diffuse hot X-ray emitting

Intracluster Gas,

trapped and heated to a temperature of the order of

$T \sim 10^8$ K

by the gravitational potential of the cluster.

At such high temperatures, this gas is a fully ionized plasma, producing powerful X-ray emission, bremsstrahlung radiation induced by the electron-ion interactions.

History of the Universe in Four Episodes: I

On the basis of the
1) complexity of the involved physics
2) our knowledge of the physical processes
we may broadly distinguish four cosmic episodes:

(I)

Origin universe

???

$t < 10^{-43}$ sec

fundamental physics:

- totally unknown

Planck Era

History of the Universe in Four Episodes: II

(II)

$10^{-43} < t < 10^{-3}$ sec

VERY early universe

fundamental physics:
- poorly known
- speculative

- Ω_{tot}: curvature/ flatness
- η_b (n_b/n_γ)
- `exotic' dark matter
- primordial fluctuations

History of the Universe in Four Episodes: III

(III)

$10^{-3} < t < 10^{13}$ sec

Standard

Hot Big Bang

Fireball

<u>fundamental microphysics</u>:

known very well

- primordial nucleo-synthesis
- blackbody radiation: CMB

History of the Universe in Four Episodes: IV

(IV)

complex macrophysics:

-Fundamentals known

- complex interplay

$t > 10^{13}$ sec

Post (Re)Combination universe

- structure formation:

  stars,
  galaxies
  clusters

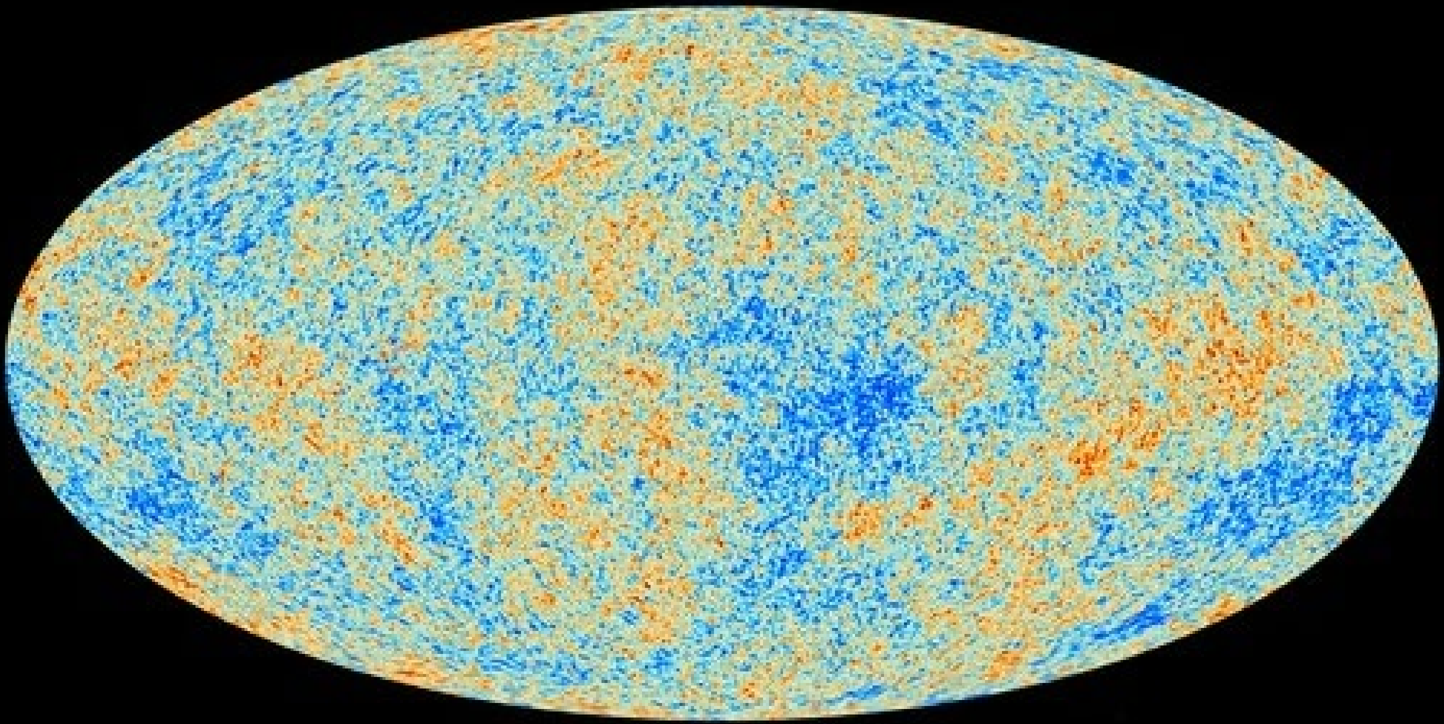
Cosmic Curvature

Cosmic Microwave Background



Map of the Universe at Recombination Epoch (Planck, 2013):

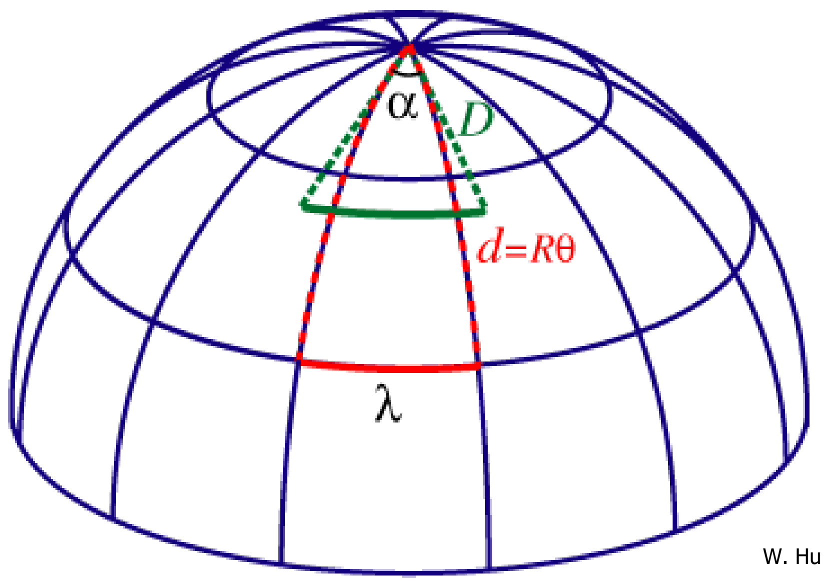
- **379,000 years after Big Bang**
- **Subhorizon perturbations: primordial sound waves**
- **$\Delta T/T < 10^{-5}$**

Measuring Curvature

Measuring the Geometry of the Universe:

- **Object with known physical size, at large cosmological distance**
- **Measure angular extent on sky**
- **Comparison yields light path, and from this the curvature of space**

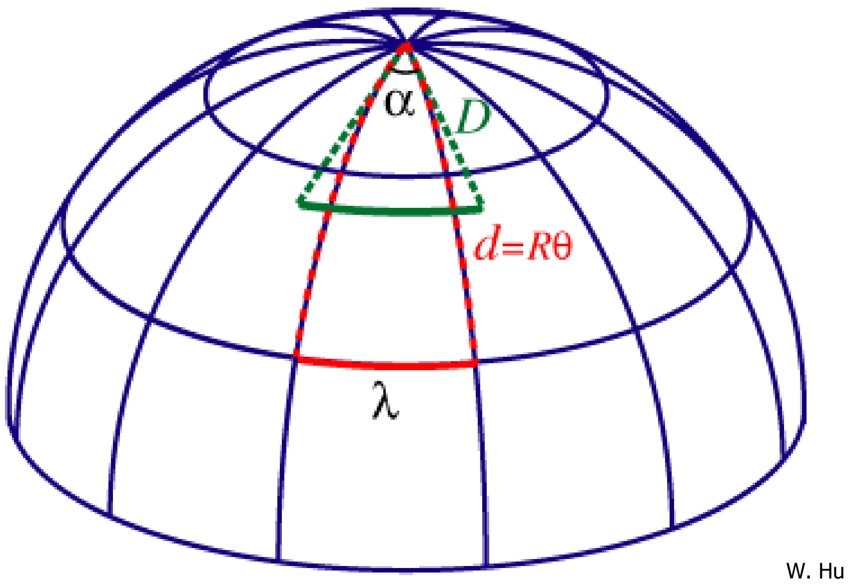
Geometry of Space



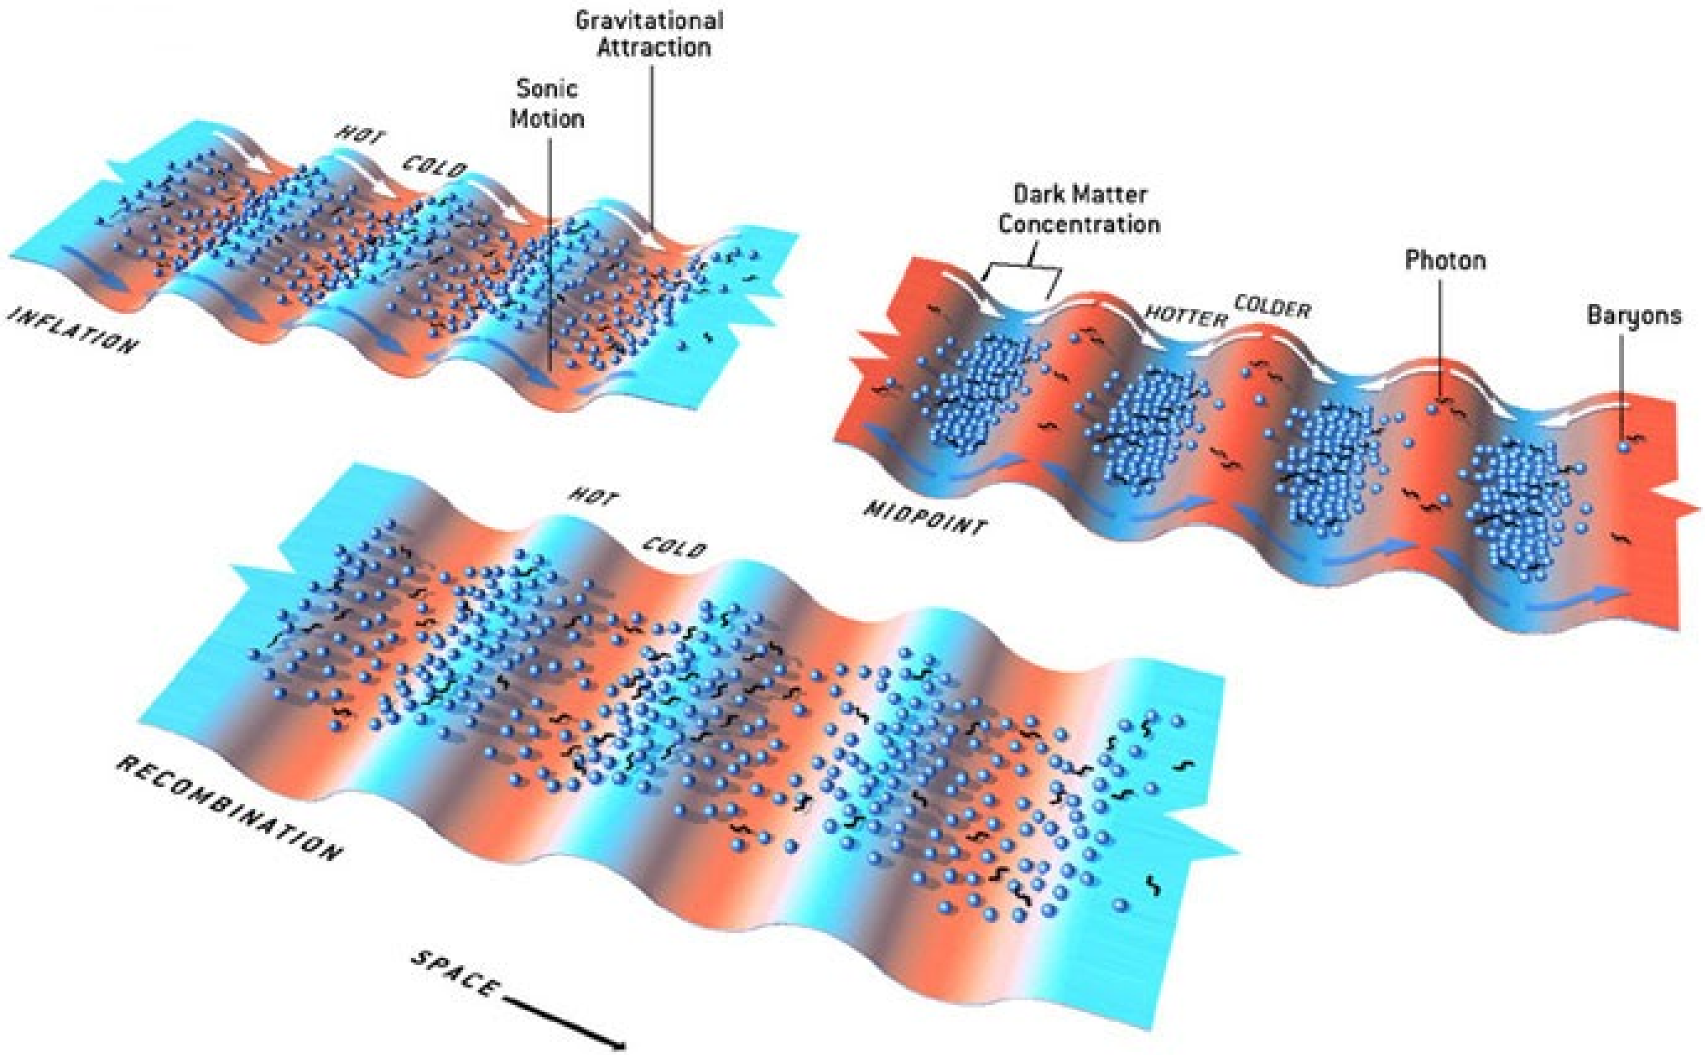
Measuring Curvature

- Object with known physical size, at large cosmological distance:
- Sound Waves in the Early Universe !!!!

Temperature Fluctuations
CMB



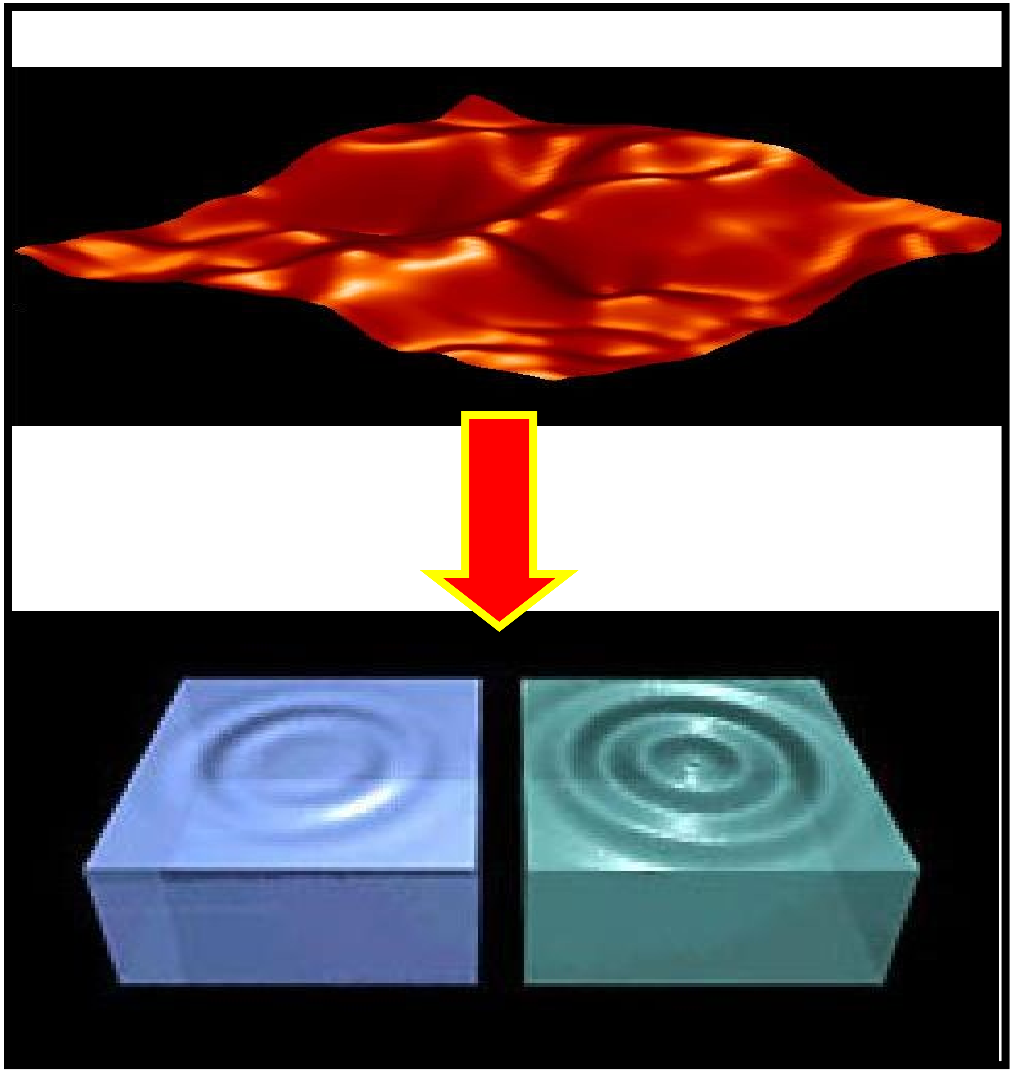
Fluctuations-Origin



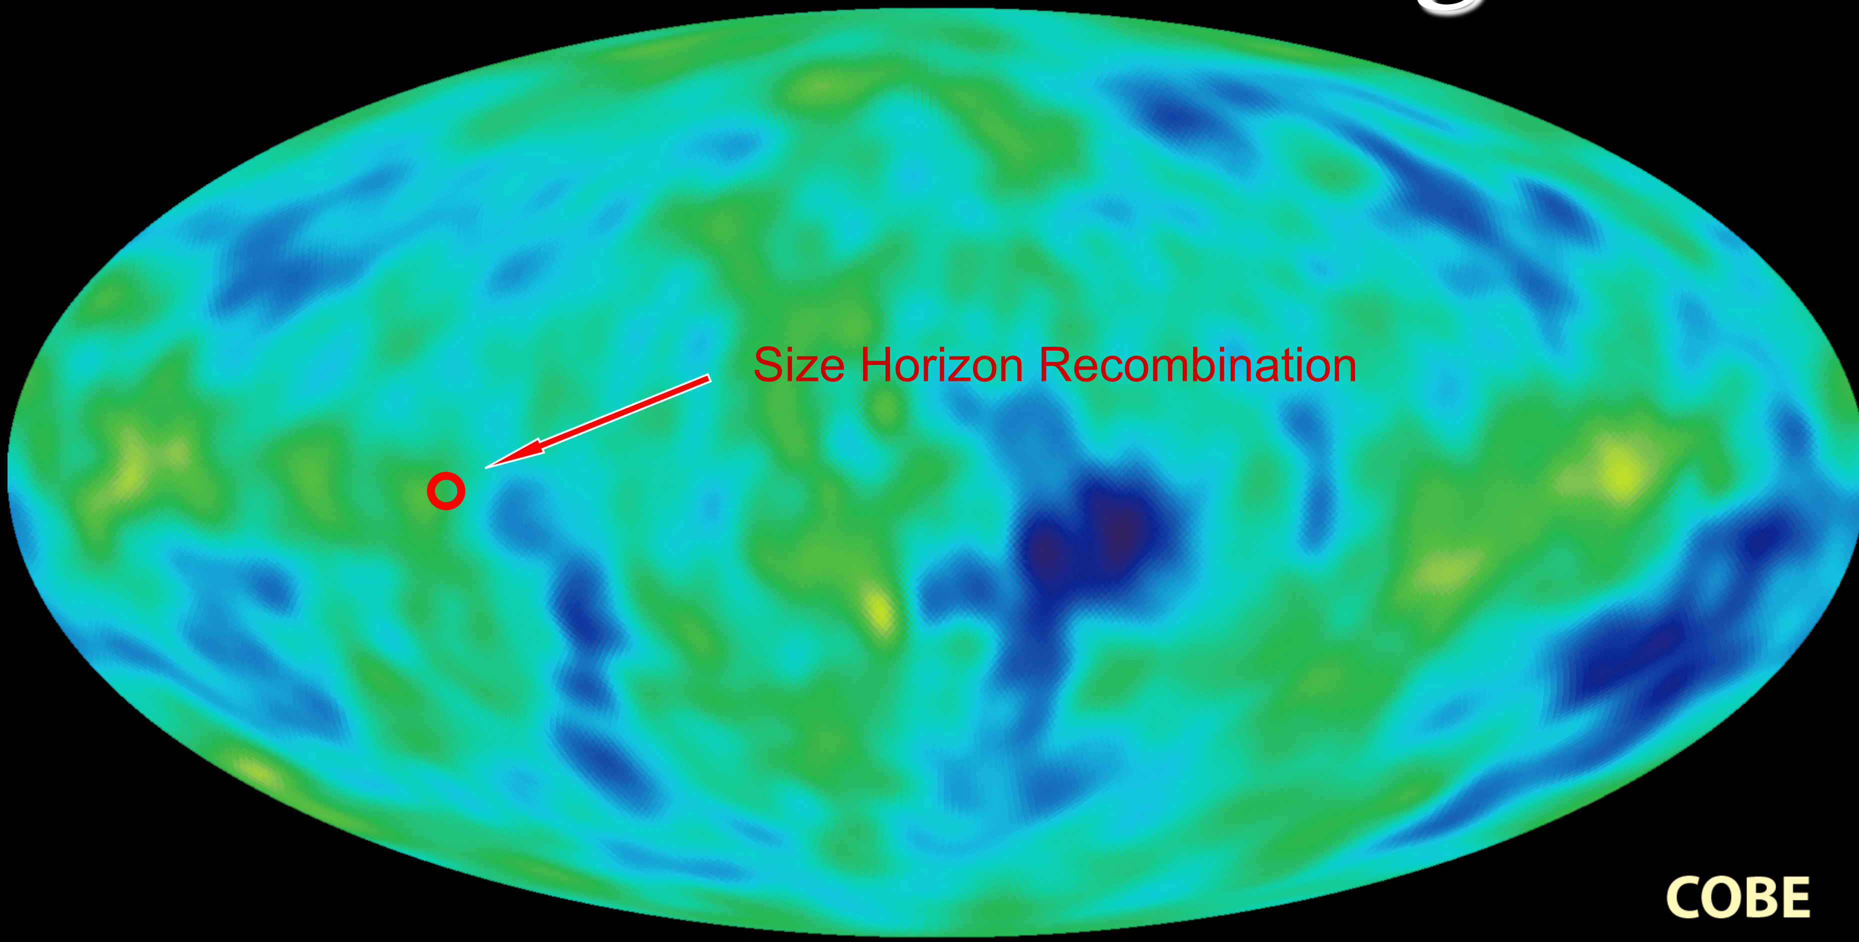
Music of the Spheres

- small ripples in
  primordial matter & photon distribution
- gravity:
  - compression primordial photon gas
  - photon pressure resists
- compressions and rarefactions
  in photon gas: sound waves
- sound waves not heard, but seen:
  - compressions: (photon) T higher
  - rarefactions: lower
- fundamental mode sound spectrum
  - size of “instrument”:
  - (sound) horizon size last scattering
- Observed, angular size: θ~1º
  - exact scale maximum compression, the
    “cosmic fundamental mode of music”

W. Hu



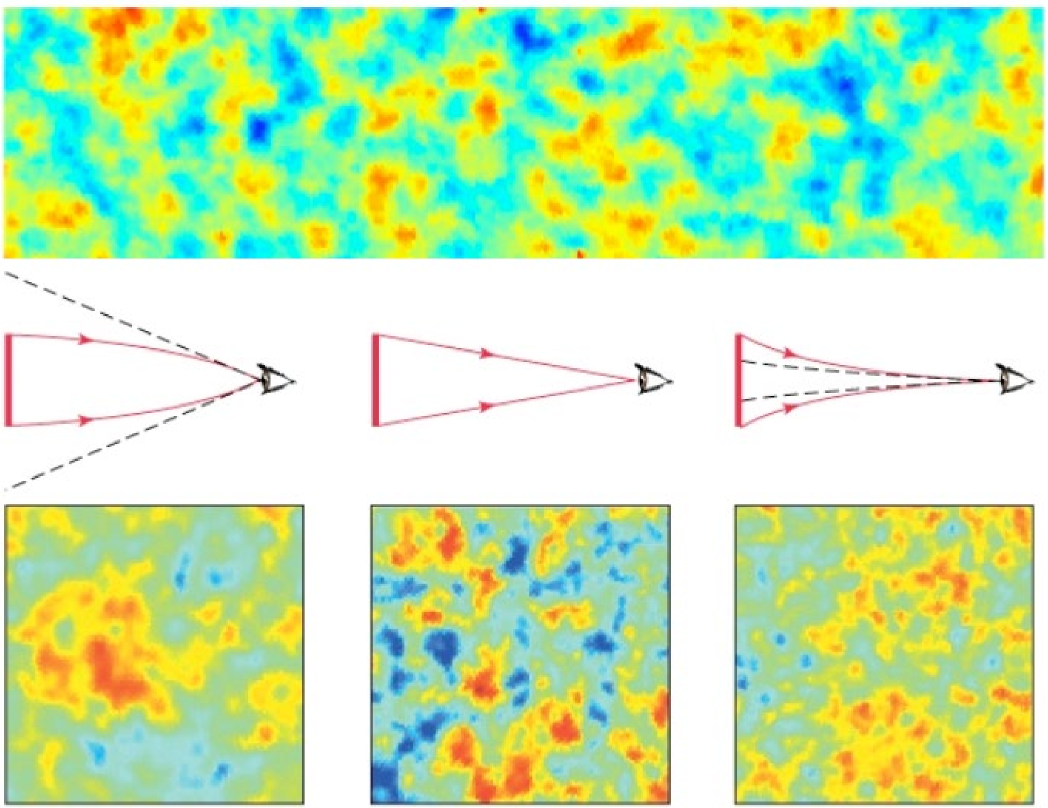
Cosmic Microwave Background



COBE measured fluctuations: $> 7^o$
Size Horizon at Recombination spans angle $\sim 1^o$

Flat universe from CMB

- **First peak: flat universe**



Closed:
hot spots
appear larger

Flat:
appear as big
as they are

Open:
spots appear
smaller

We know the redshift and the time it took for the light to reach us:

from this we know the
- length of the legs of the triangle
- the angle at which we are measuring the sound horizon.

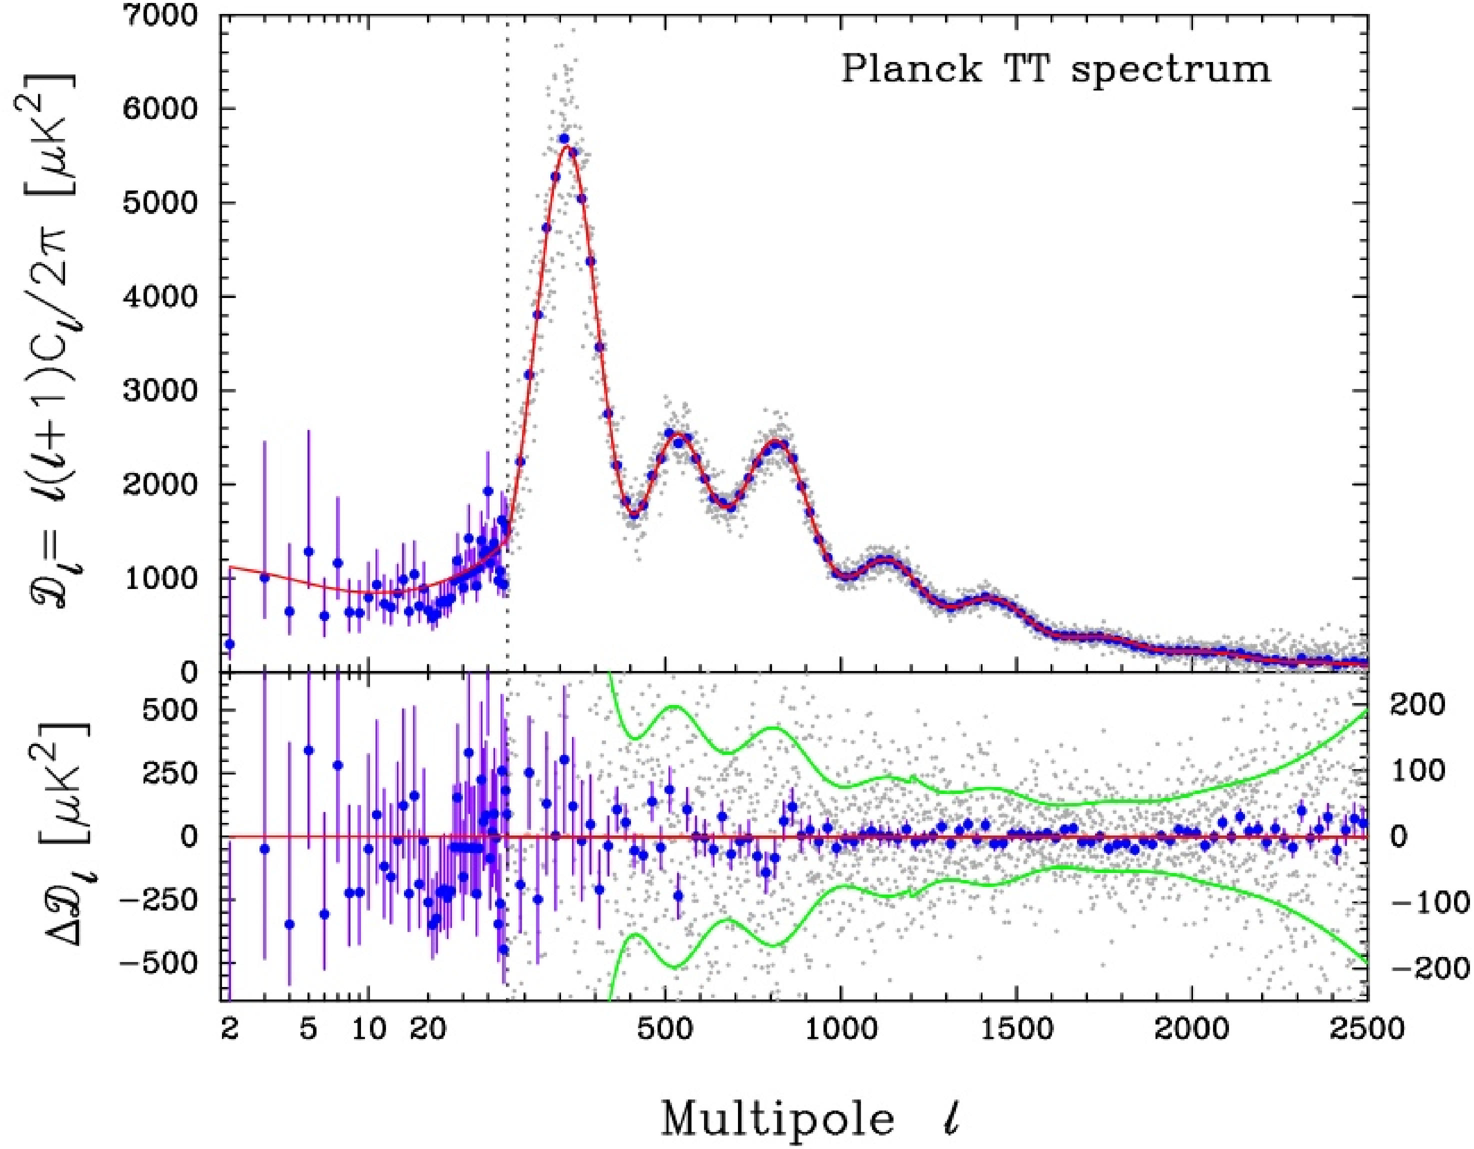
The Cosmic Microwave Background Temperature Anisotropies: Universe is almost perfectly FLAT !!!!

CMB - Fluctuations



Standard Big Bang:

what it cannot explain …

- **Flatness Problem**
  the Universe is remarkably flat, and was even (much) flatter in the past

- **Horizon Problem**
  the Universe is nearly perfectly isotropic and homogeneous,   much more so in the past

- **Monopole Problem:**
  There are hardly any magnetic monopoles in our Universe

- **Fluctuations, seeds of structure**
  Structure in the Universe: origin

Flatness Problem

Flatness Problem

FRW Dynamical Evolution:

Going back in time, we find that the Universe was much flatter than it is at the present.

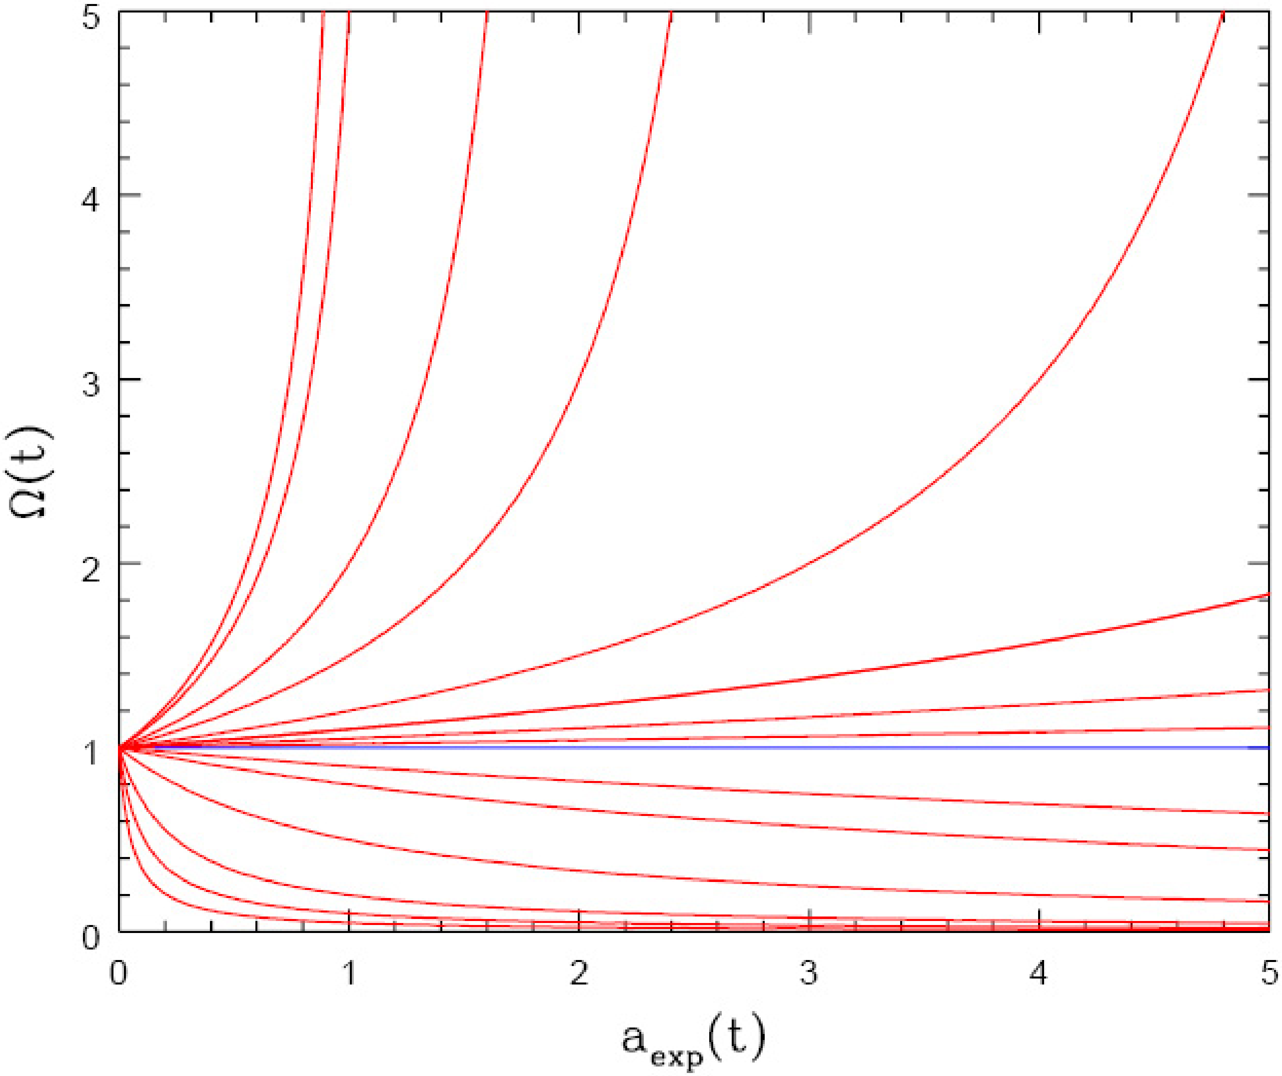
Reversely, that means that any small deviation from flatness in the early Universe would have been strongly amplified nowadays …

We would therefore expect to live in a Universe that would either be almost
⍰=0 or ⍰⍰⍰;

Yet, we find ourselves to live in a Universe that is almost perfectly flat … $⍰_{tot}$⍰1

How can this be ?

Flatness Evolution



$$\left(\frac{1}{\Omega}-1\right)=a(t)\left(\frac{1}{\Omega_0}-1\right)$$

- At radiation-matter equiv.

$$\left|1-\Omega_{rm}\right|\leq 2\times 10^{-4}$$

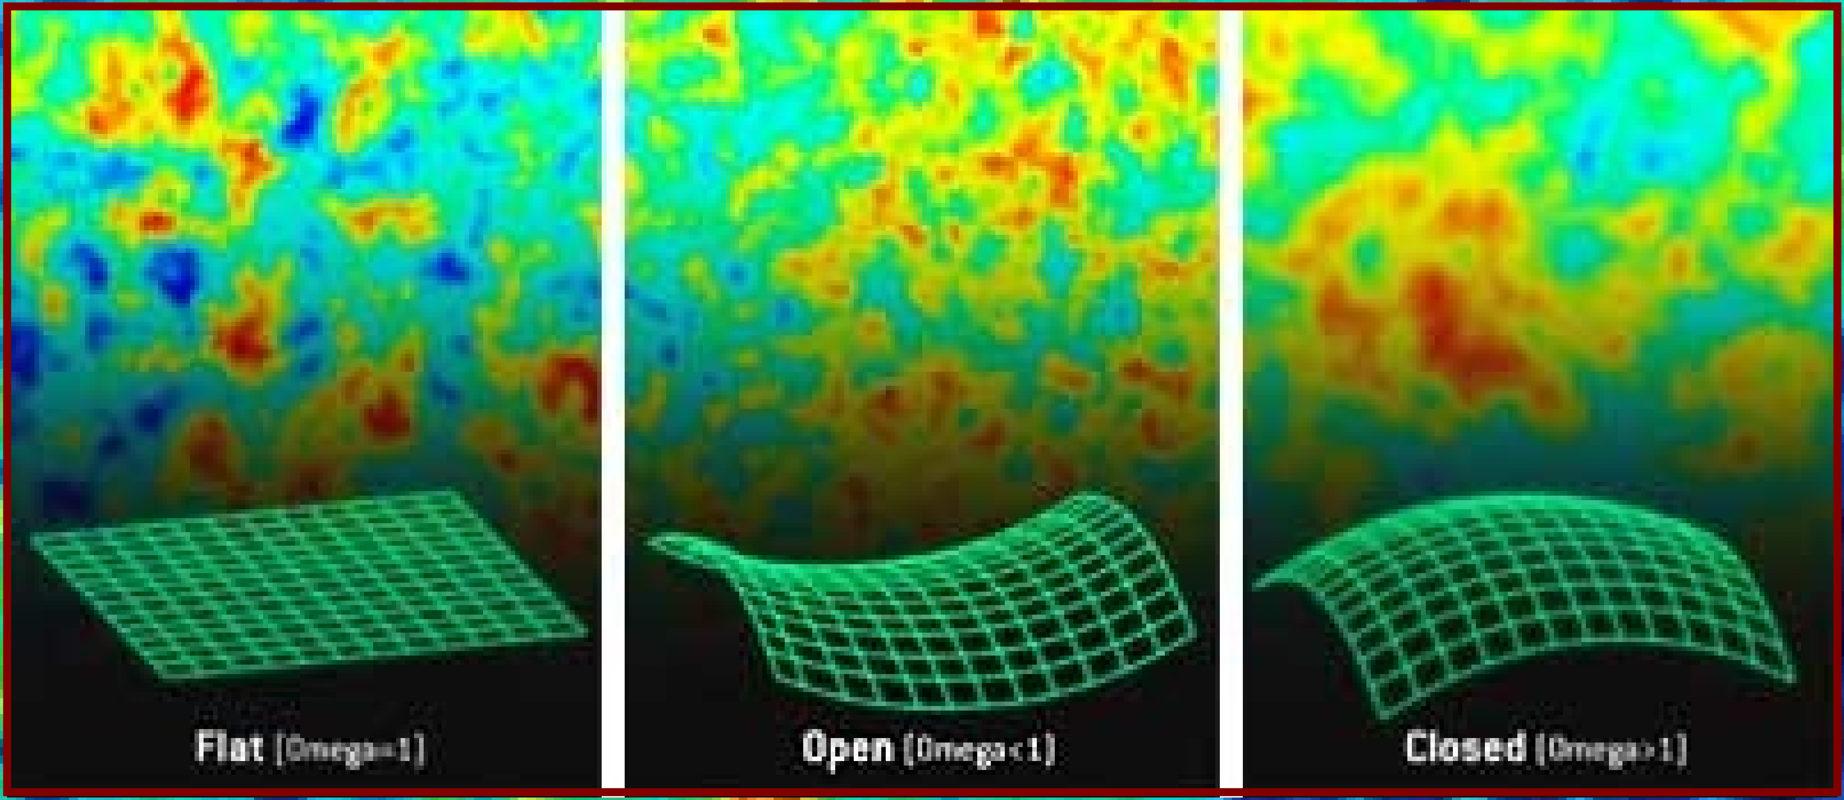
- Big Bang nucleosynthesis
  $a_{nuc} \approx 3.6 \times 10^{-8}$

$$\left|1-\Omega_{nucl}\right|\leq 3\times 10^{-14}$$

- Planck time

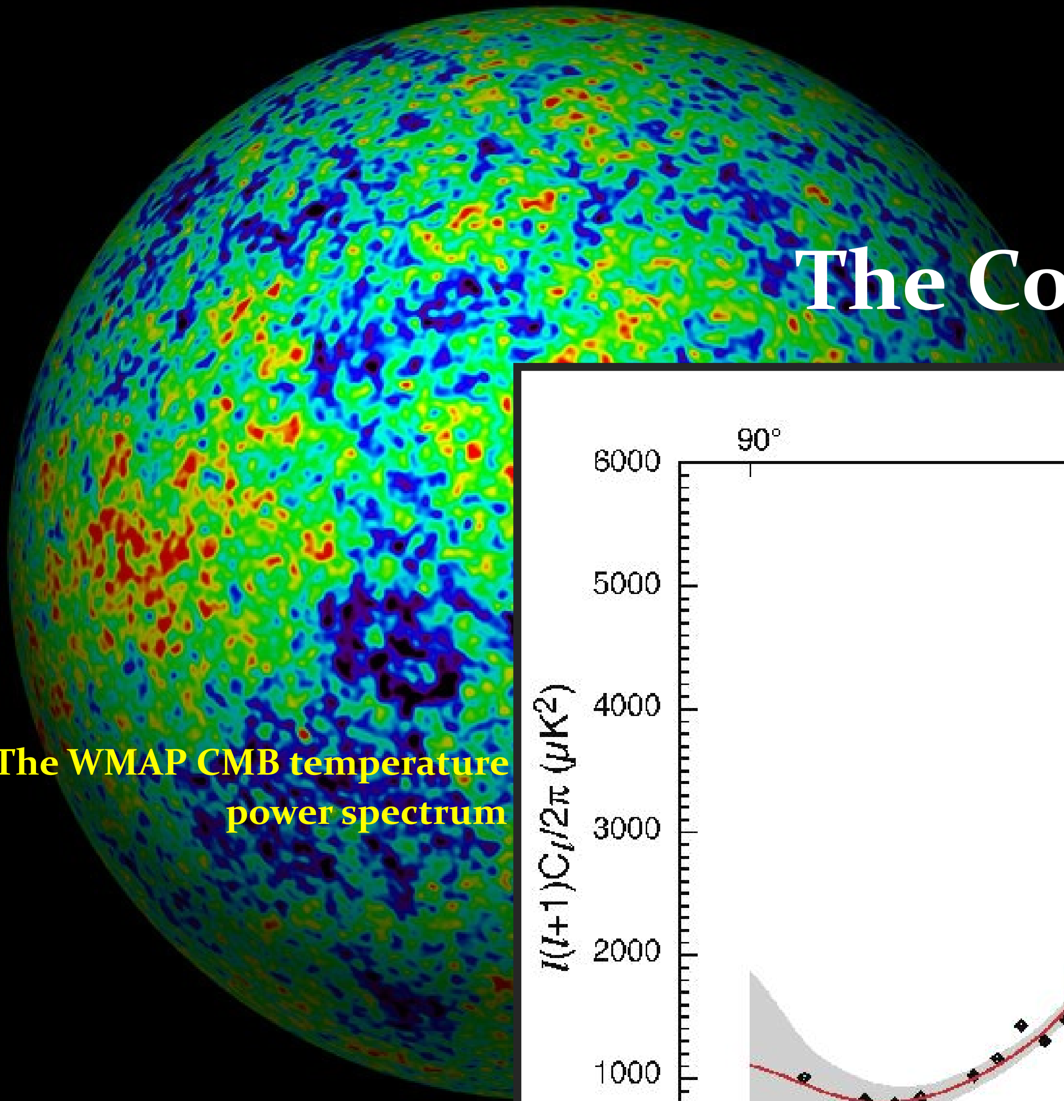
$$\left|1-\Omega_{P}\right|\leq 1\times 10^{-60}$$

Angular CMB temperature fluctuations

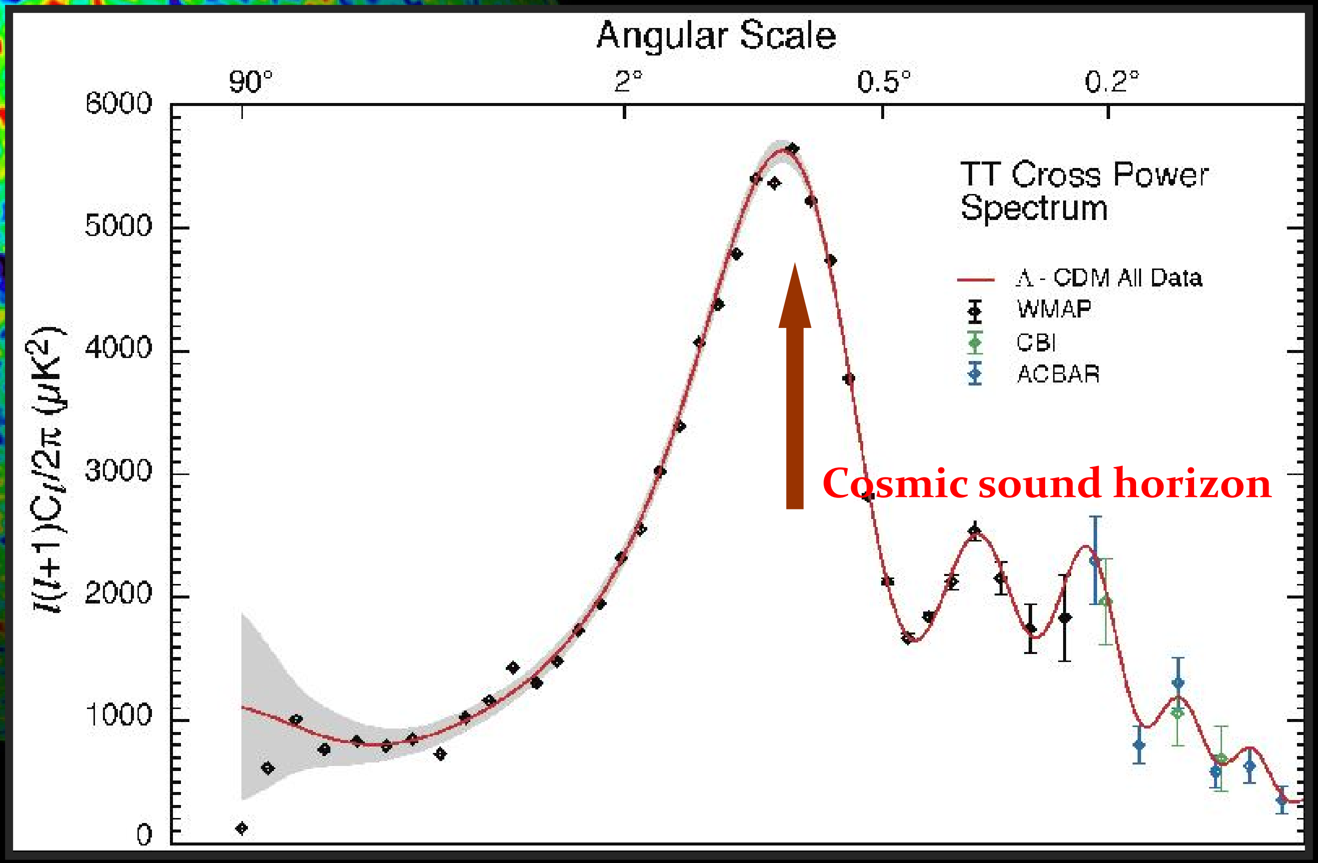


CMB: Universe almost perfectly Flat !

The Cosmic Tonal Ladder



The WMAP CMB temperature power spectrum



The Cosmic Microwave Background Temperature Anisotropies: Universe is almost perfectly flat

Horizon Problem

Cosmic Horizons

Fundamental Concept for our understanding of the physics of the Universe:

- Physical processes are limited to the region of space with which we are or have ever been in physical contact.
- What is the region of space with which we are in contact ?
  Region with whom we have been able to exchange photons
  (photons: fastest moving particles)
- From which distance have we received light.
- Complication: - light is moving in an expanding and curved space
  - fighting its way against an expanding background
- This is called the

Horizon of the Universe

Cosmic Horizons

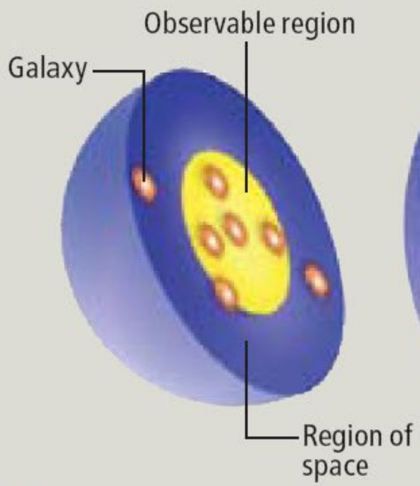
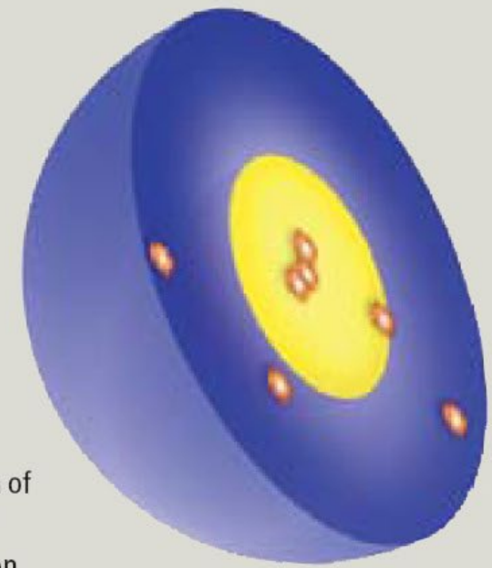
EXPANDING UNIVERSE, SHRINKING VIEW

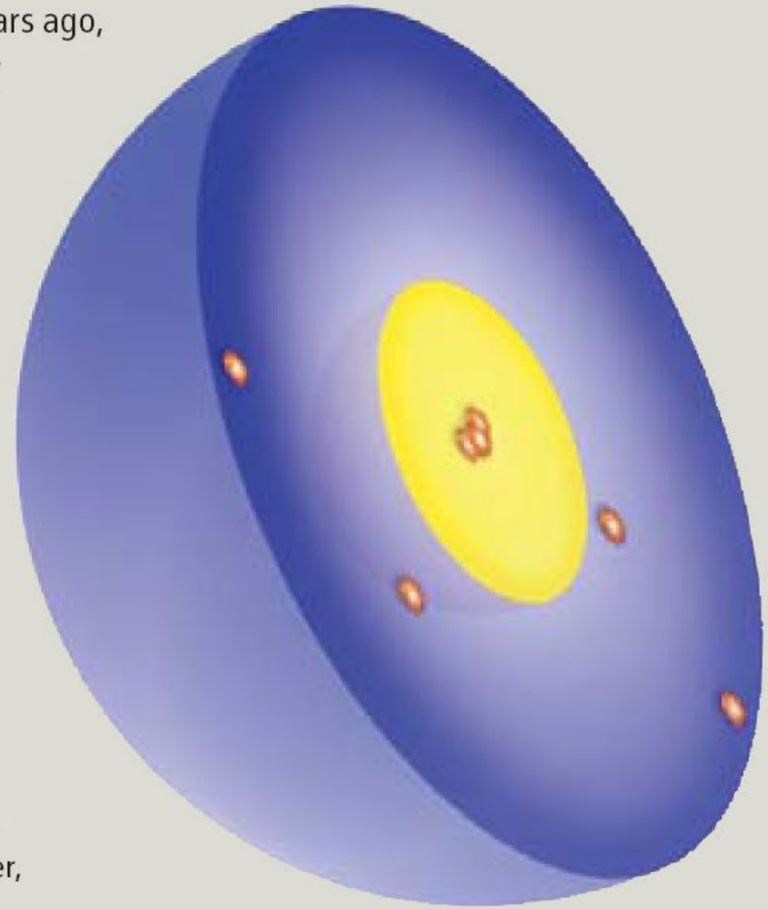
The universe may be infinite, but consider what happens to the patch of space around us (*purple sphere*), of which we see only a part (*yellow inner sphere*). As space expands, galaxies (*orange spots*) spread out. As light has time to propagate, we observers on Earth (or our predecessors or descendants) can see a steadily increasing volume of space. About six billion years ago, the expansion began to accelerate, carrying distant galaxies away from us faster than light.



1 At the onset of acceleration, we see the largest number of galaxies that we ever will.



2 The visible region grows, but the overall universe grows even faster, so we actually see a smaller fraction of what is out there.



3 Distant galaxies (those not bound to us by gravity) move out of our range of view. Meanwhile, gravity pulls nearby galaxies together.

NOTE:
Because space is expanding uniformly, alien beings in other galaxies see this same pattern.
