Lecture course University Groningen Nov. 2012-Jan 2013

# Gravitational Instability

$$\frac{\partial \delta}{\partial t} + \frac{1}{a} \nabla \cdot (1 + \delta) \mathbf{v} = 0$$

$$\frac{\partial \mathbf{v}}{\partial t} + \frac{\dot{a}}{a}\mathbf{v} + \frac{1}{a}(\mathbf{v} \cdot \nabla)\mathbf{v} = -\frac{1}{a}\nabla\phi$$

$$\nabla^2 \phi = 4\pi G \,\bar{\rho} \, a^2 \,\delta(\mathbf{x}, t)$$

### Gravitational Instability

$$\frac{\partial \delta}{\partial t} + \frac{1}{a} \nabla \cdot \mathbf{v} = 0$$

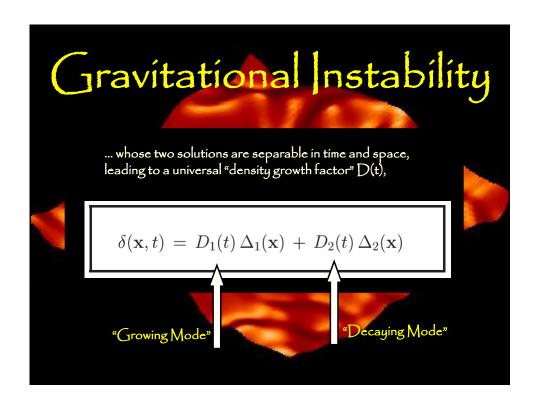

$$\frac{\partial \mathbf{v}}{\partial t} + \frac{\dot{a}}{a} \mathbf{v} = -\frac{1}{a} \nabla \phi$$

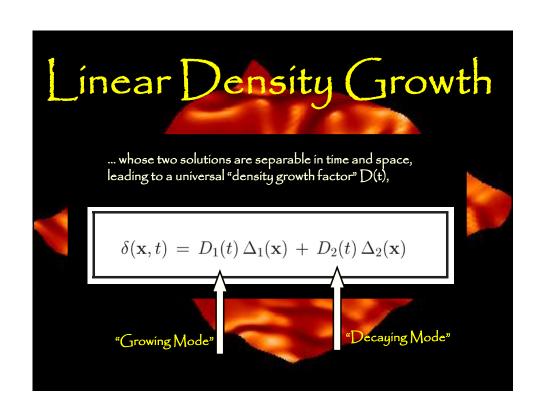

$$\nabla^2 \phi = \frac{3}{2} \Omega H^2 a^2 \ \delta(\mathbf{x}, t)$$

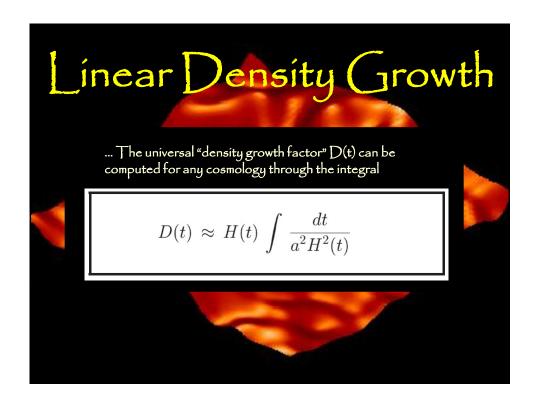

# Gravitational Instability

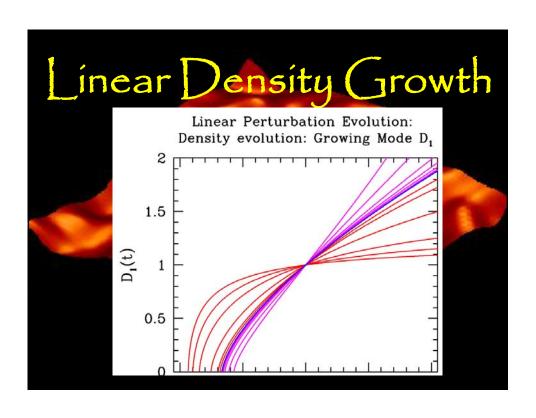

The linear system of structure growth equations can be written in terms of a second order differential equation,

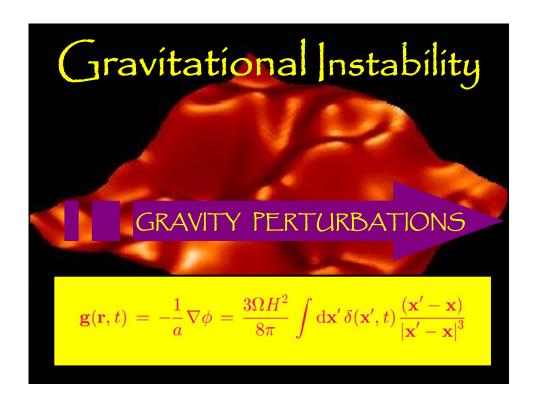

$$\frac{\partial^2 \delta}{\partial t^2} \, + \, 2 \frac{\dot{a}}{a} \, \frac{\partial \delta}{\partial t} \, = \, \frac{3}{2} \Omega_0 H_0^2 \, \frac{1}{a^3} \, \delta$$

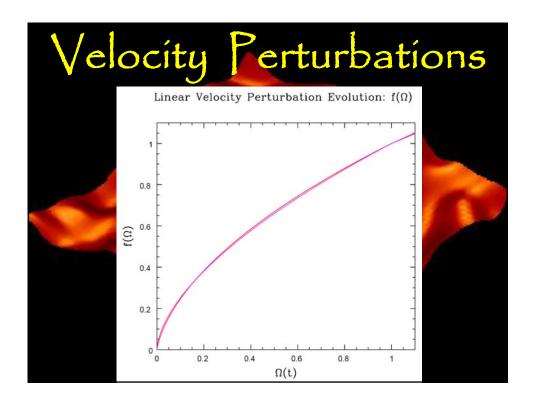

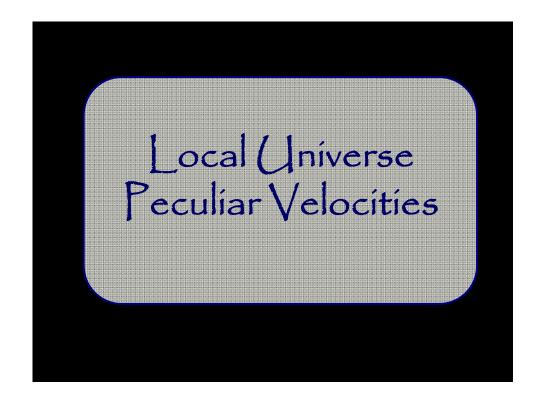

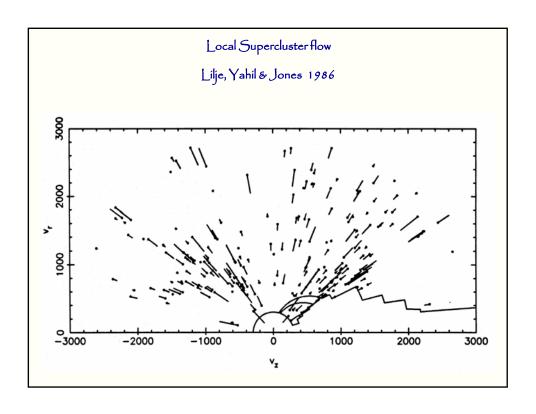

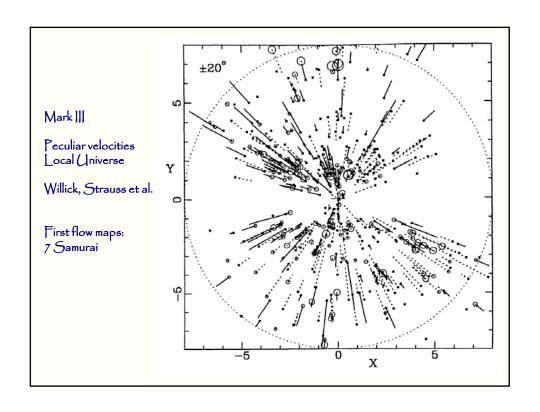

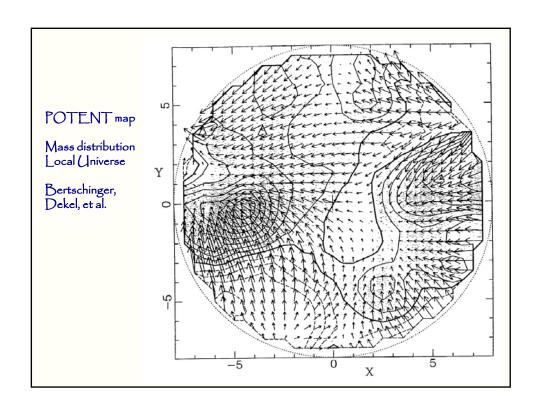

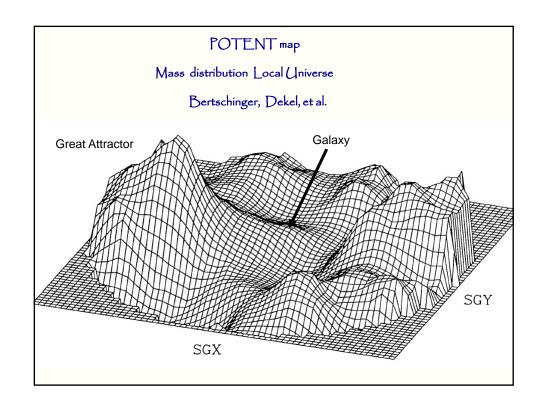

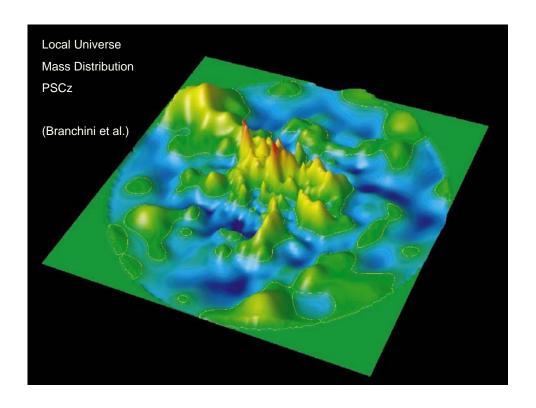

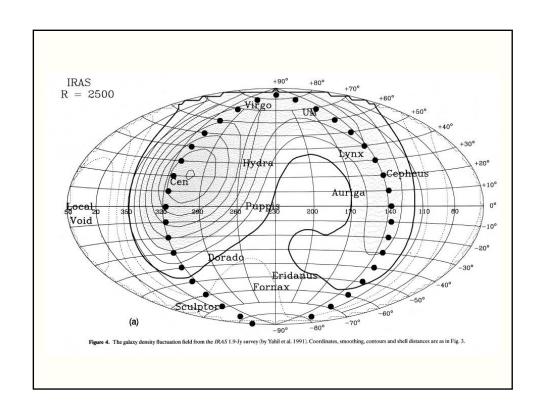

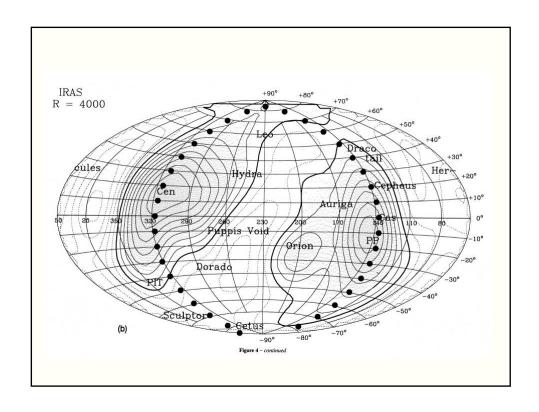

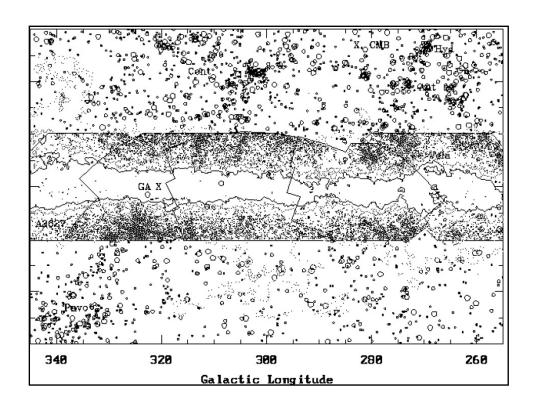

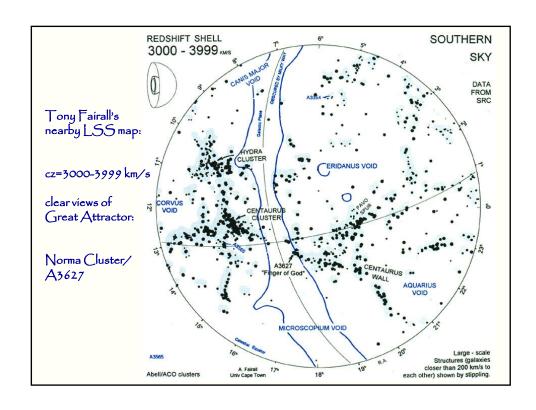

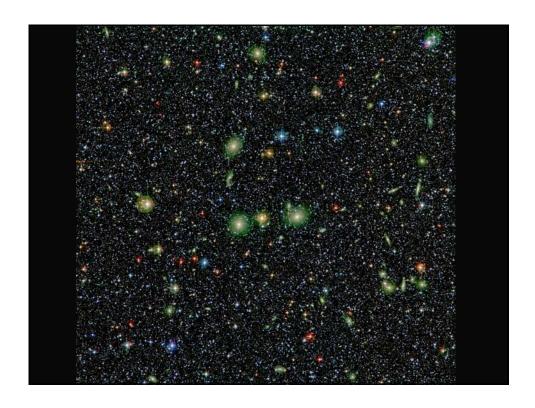

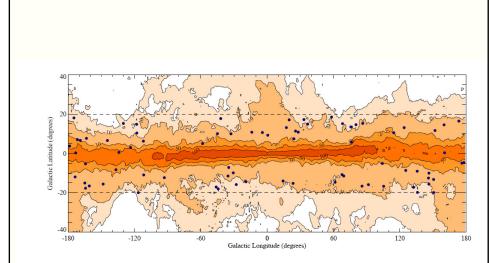

**Fig. 16.** Distribution in Galactic coordinates of the 76 by Ebeling et al. [129] so far spectroscopically confirmed X-ray clusters (solid dots) of which 80% were previously unknown. Superimposed are Galactic HI column densities in units of  $10^{20}$  cm<sup>-2</sup> (Dickey & Lockman 1990). Note that the region of relatively high absorption  $(N_{\rm HI} > 5 \times 10^{21}$  cm<sup>-2</sup>) actually is very narrow and that clusters could be identified to very low latitudes

$$v_{LG} = \frac{H_0 \beta}{4\pi} \int_{r}^{\infty} d^3 r' \delta_g(r') \frac{r' - r}{|r' - r|^3}$$

$$v(r) = \frac{H_0 \beta}{4\pi \bar{n}} \sum_{i}^{N} \frac{w_i \hat{r}_i}{r_i^2}$$

#### 2MASS survey

- 2MASS all-sky survey: ground-based near-infrared survey whole sky, J(1.2  $\mu$ m), H(1.6  $\mu$ m), K(2.2  $\mu$ m)
- 2MASS extended source catalog (XSC): 1.5 million galaxies
- unbiased sample nearby galaxies
- photometric redshifts: depth in 2MASS maps, "cosmic web" of (nearby) superclusters spanning the entire sky.
