The HI/Story of the Nearby Universe

Overview

- 1 Introduction
- 2 Data set
- 3 Rotation curves
- 4 Comparison to the data
- 5 Preliminary
- 6 Summary

Introduction 1

- Angular momentum (AM) is a fundamental galaxy property.
- In a CDM Universe, AM is closely linked to a galaxy's formation history.
- High-precision studies of the AM content of various types are made possible by current and forthcoming instruments.

Introduction 2

- Fall and his collaborators have shown that early- and late-types have different amounts of AM.
- High-precision studies show a well-defined relationship between j_b and M_b .
- However, all high-precision studies so far have focused on late-types.

Figure : Traditional study of j_* - M_* relation (Romanowsky & Fall (2012)).

Figure : High-precision studies (using rotational curves and radial profiles) of j_b - M_b relation from several studies.

Angular momentum measure

Total baryonic mass is given by:

$$M_b = \int_0^{R_{\text{out}}} \Sigma_b(R) \cdot 2\pi R \cdot dR$$

- $\Sigma_b(R)$ is azimuthally averaged baryonic mass surface density distribution.

Total baryonic angular momentum J_b is given by,

$$J_b = \int_0^{R_{\text{out}}} 2\pi R \cdot \Sigma_b(R) \cdot V_{\text{rot}} \cdot R \cdot dR$$

where $\Sigma_b(R) = \Sigma_{\text{HI+He}}(R) + \Sigma_{\star}(R)$

Data set

- Primary data set: 30 arcsec HI data cubes from WHISP.
- Sample of 11 galaxies selected from the sample of 68 WHISP early-types from Noordermeer et al. (2005)

Sample selection criterion

- $D_{\text{HI}} > 180$ arcsec (6 beams) and
- $40^\circ < i_{\text{HI}} < 75^\circ$.

Optical imaging (Digitized Sky Survey 1)

Some basic properties

Table : Sample properties (1) UGC number, (2) alternative name, (3) RA, (4) Dec, (5) morphological type, (6) absolute B-band magnitude, (7) heliocentric radial velocity from this study, (8) distance, (9) inclination angle from this study.

UGC	Alternative name	RA (2000) h m s	Dec (2000) ° ' "	Type	M_B	V_{hel} km s^{-1}	D Mpc	i °

HI cube parameterisation

1. Line profiles in HI cube were fitted with Gaussians.
2. For all fitted Gaussians with peak amplitude $> 3\sigma$:
 - Areas of Gaussians \rightarrow HI total intensity map.
 - Peak-velocities \rightarrow Velocity field.
 - Dispersions \rightarrow HI dispersion map.

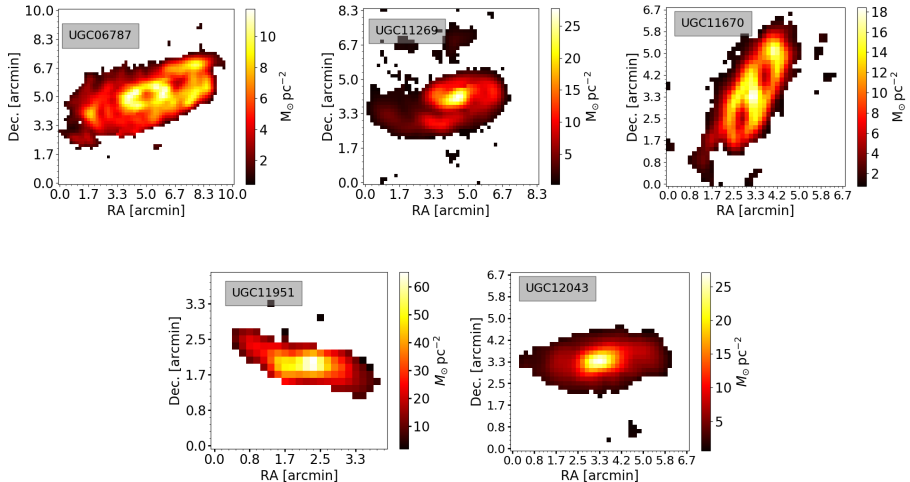

HI total intensity maps & velocity fields

1. HI total intensity maps:

HI total intensity maps & velocity fields

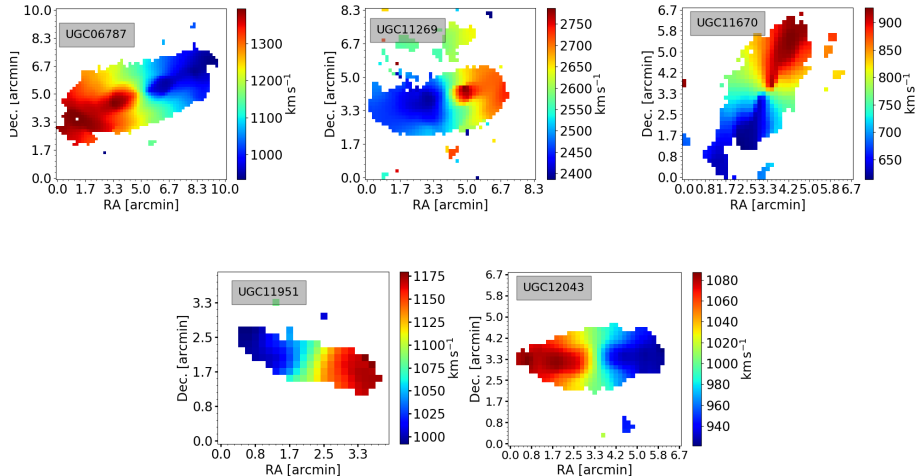

HI total intensity maps & velocity fields

2. Velocity fields:

Observed HI Global profiles cont ..

Derive rotation curves

We used ROTCUR routine in GIPSY to derive rotation curves.

ROTCUR approach

- Fitting tilted-rings to the velocity fields (both halves) in two iterations:
- 1st iteration: all parameters set free.
- 2nd iteration: all parameters (except V_{rot}) set to median values from previous iteration.

Rotation curves

Rotation curves cont ..

Model-data comparisons

We compared TR models to data in different ways:

1. Velocity fields comparisons.
2. Used TR models to generate 3D model cubes (GALMOD) in order to compare directly to HI data cubes:
 - Major axis pv-slice model-data comparisons.
 - Full-channel-by-channel comparisons.

Main conclusion: Rotation curves are accurate.

Preliminary

Preliminary

Summary

- 11 early-type WHISP galaxies used to study baryonic $j_b - M_b$ relation.
- We re-derived all HI data products and rotation curves.
- Careful model-data comparison show our rotation curves to be accurate.
- No evidence found for an off-set in baryonic angular momentum content of early-types.
- Currently: carefully checking our measurements for all our galaxies.
