

MAGNHIFFIC - MeerKAT AGN HI Feeding and Feedback Investigation close-by

Filippo M. Maccagni

E. de Blok, J. Healy, D. Kleiner @ MHONGOOSE Survey Team

P. Serra, A. Loni, F. Loi @ MeerKAT Fornax Survey

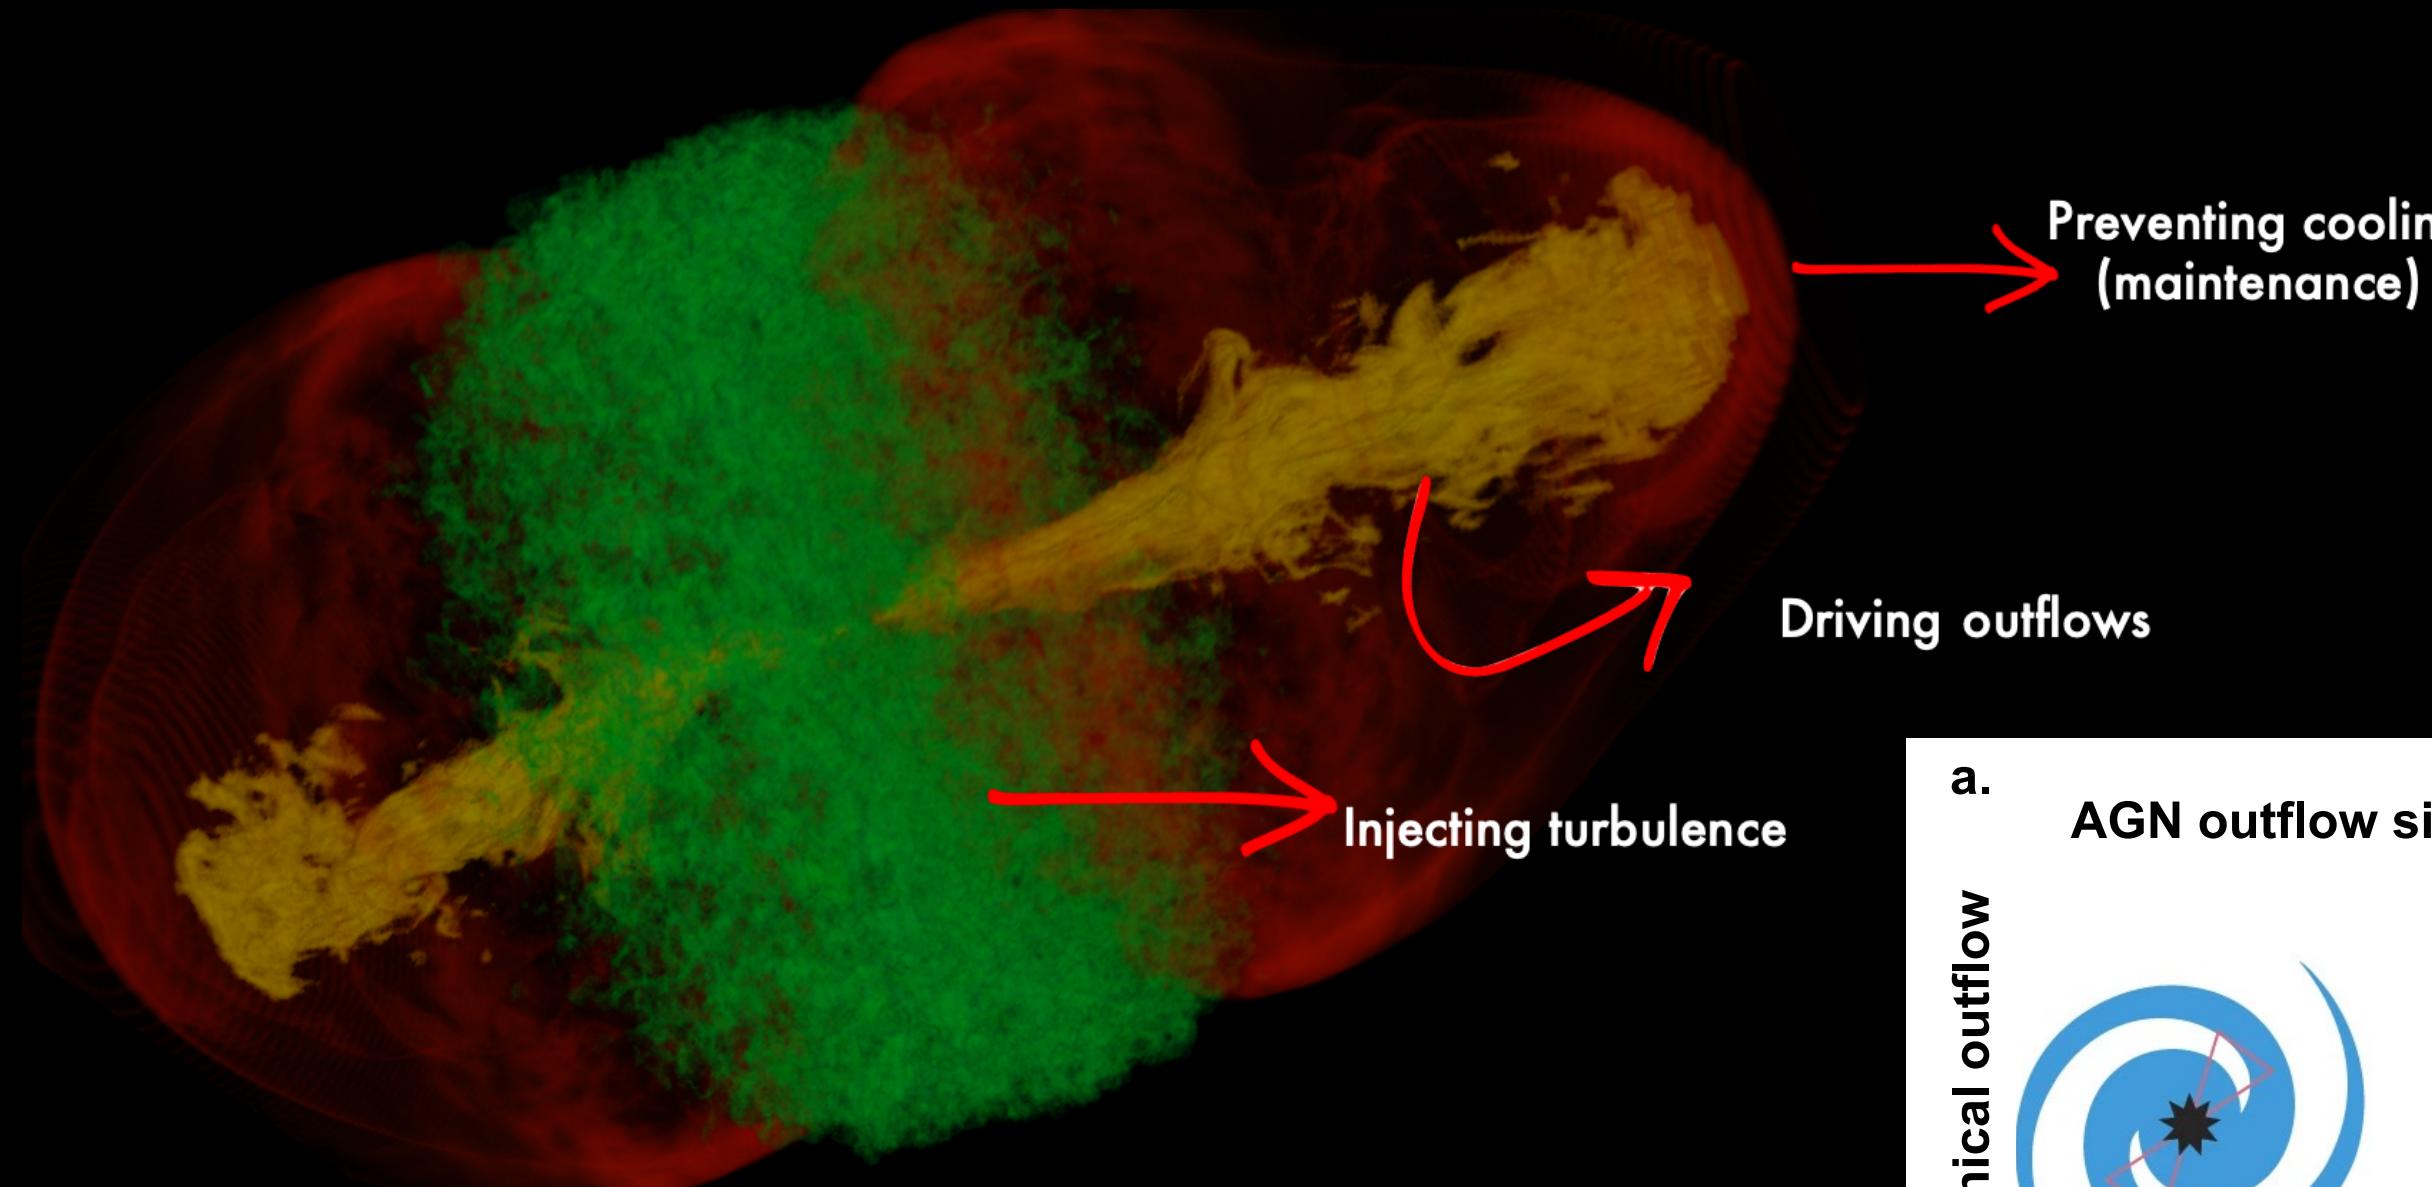

+ A. Marasco, I. Prandoni, I. Ruffa, M. Gaspari, E. Iodice, R. Ragusa, R. Morganti, T. Oosterloo

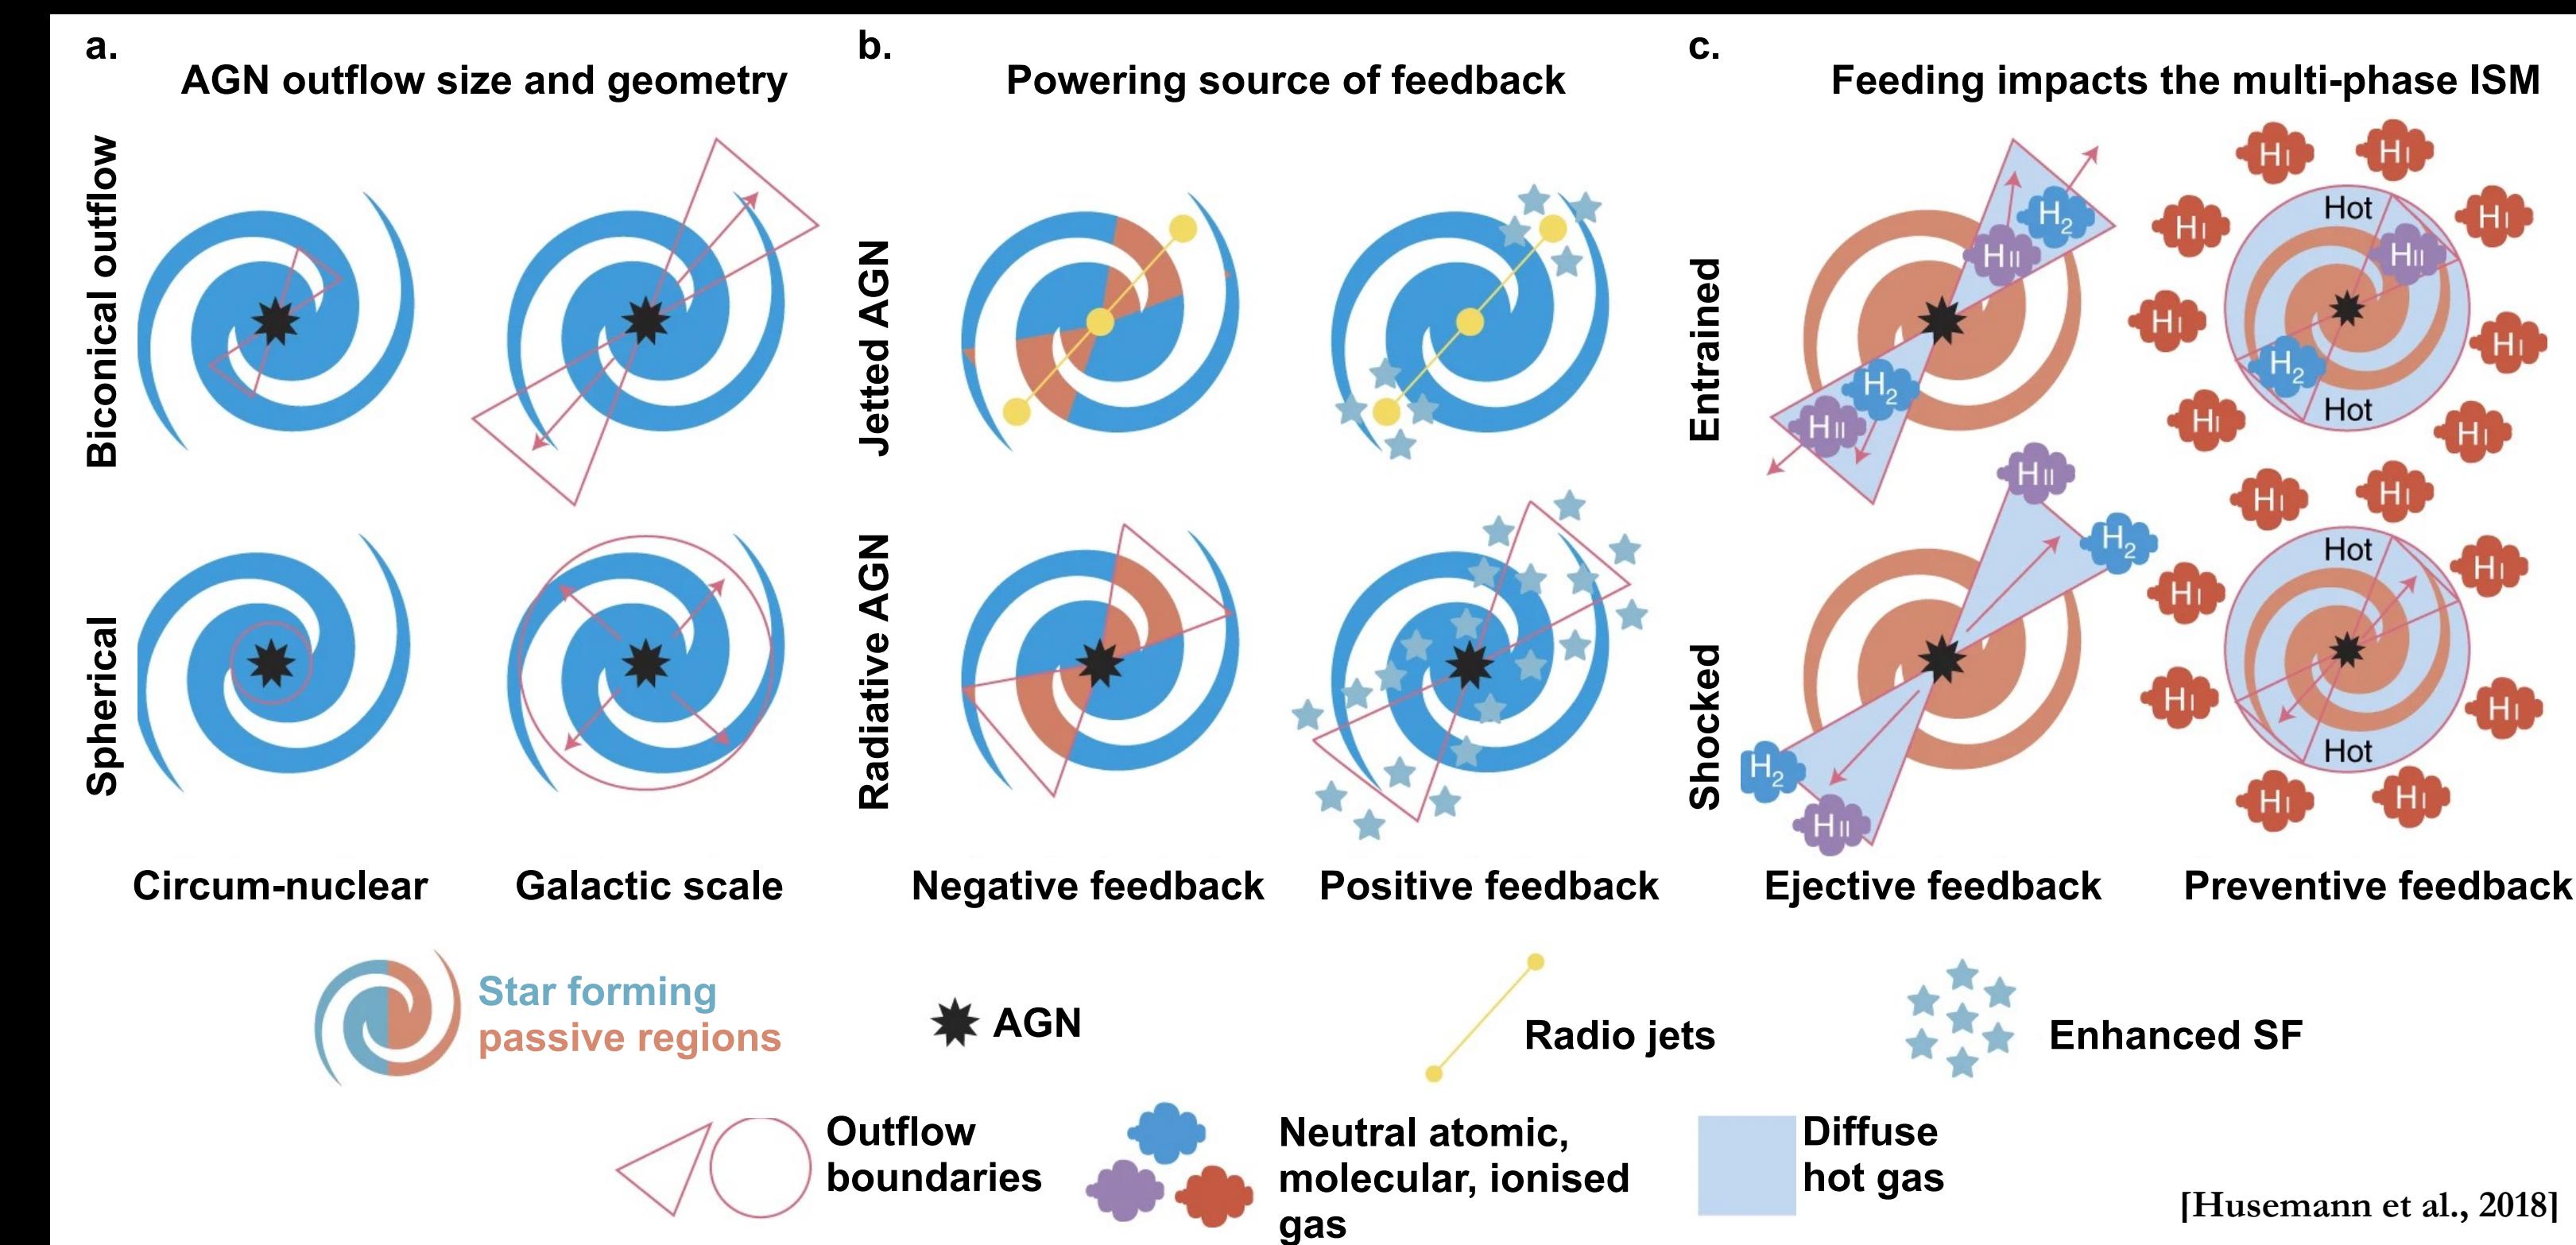

This project has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (grant agreement no. No 882793/MeerGas).

HI deep studies - AGN Feeding and Feedback

Simulation
courtesy of D. Mukherjee

- AGN radiative winds and radio plasma jet/lobes generate (massive) multi-phase outflows
- Negative and positive feedback
- Cold gas fuels nuclear activity (recursively?): feeding
- How F&F affect SF and the evolution of galaxies?

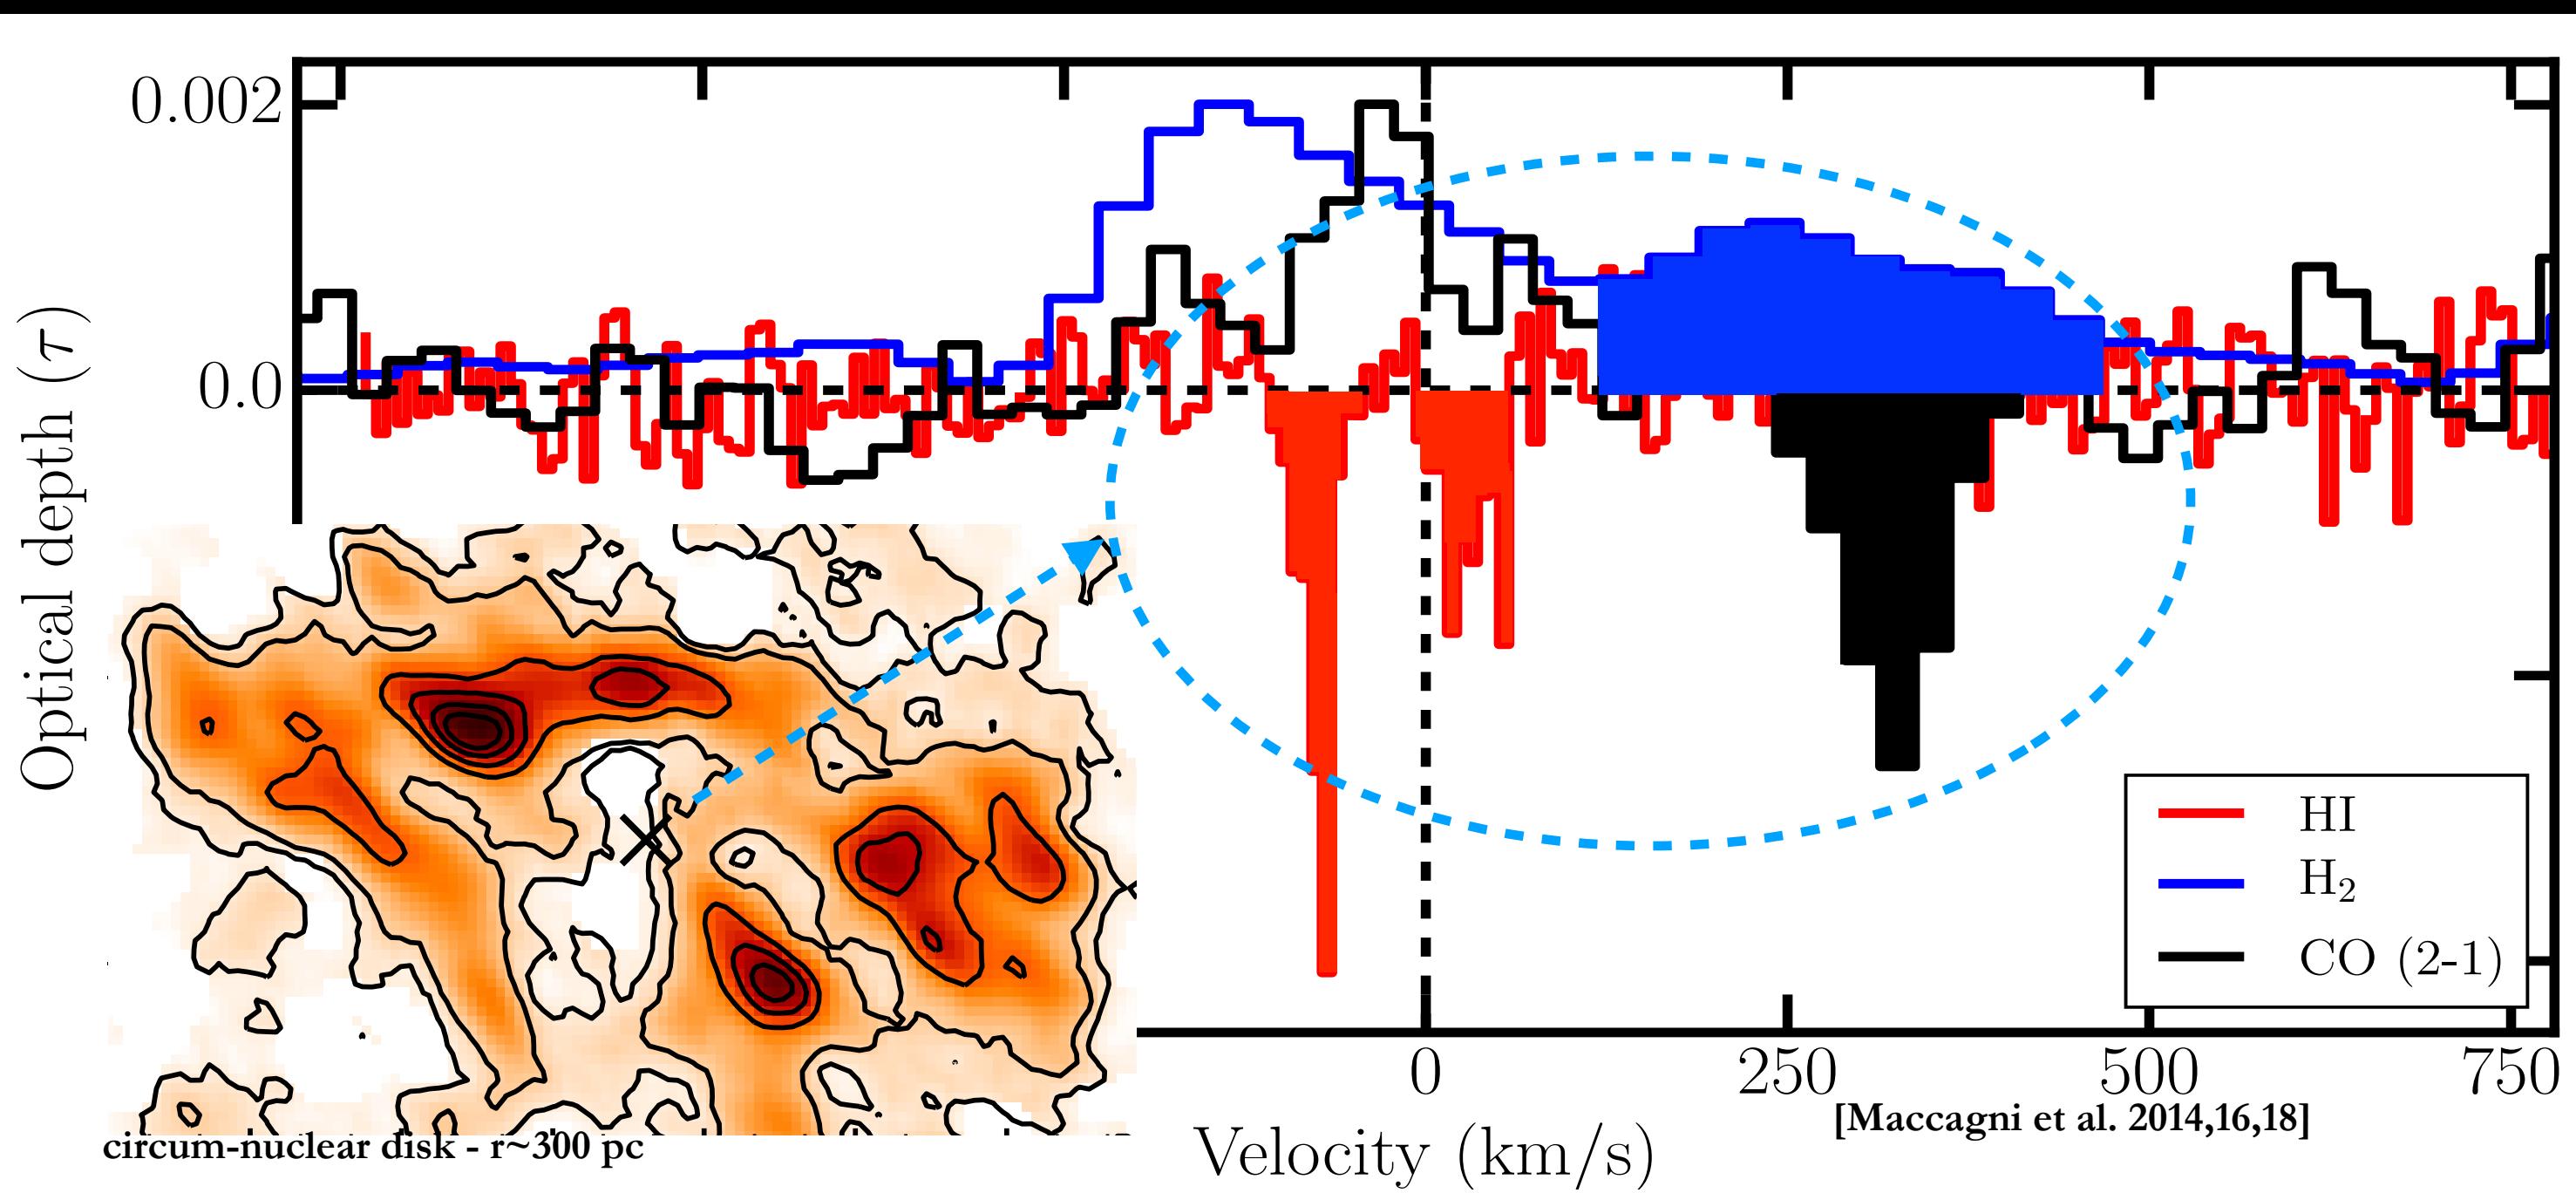

HI deep studies - AGN Feeding and Feedback

- HI traces the neutral atomic phase (i.e. most massive phase) of gas involved in AGN feeding mechanism
- Because of the low-column density of gas involved in F&F so far most HI studies have been limited to absorption

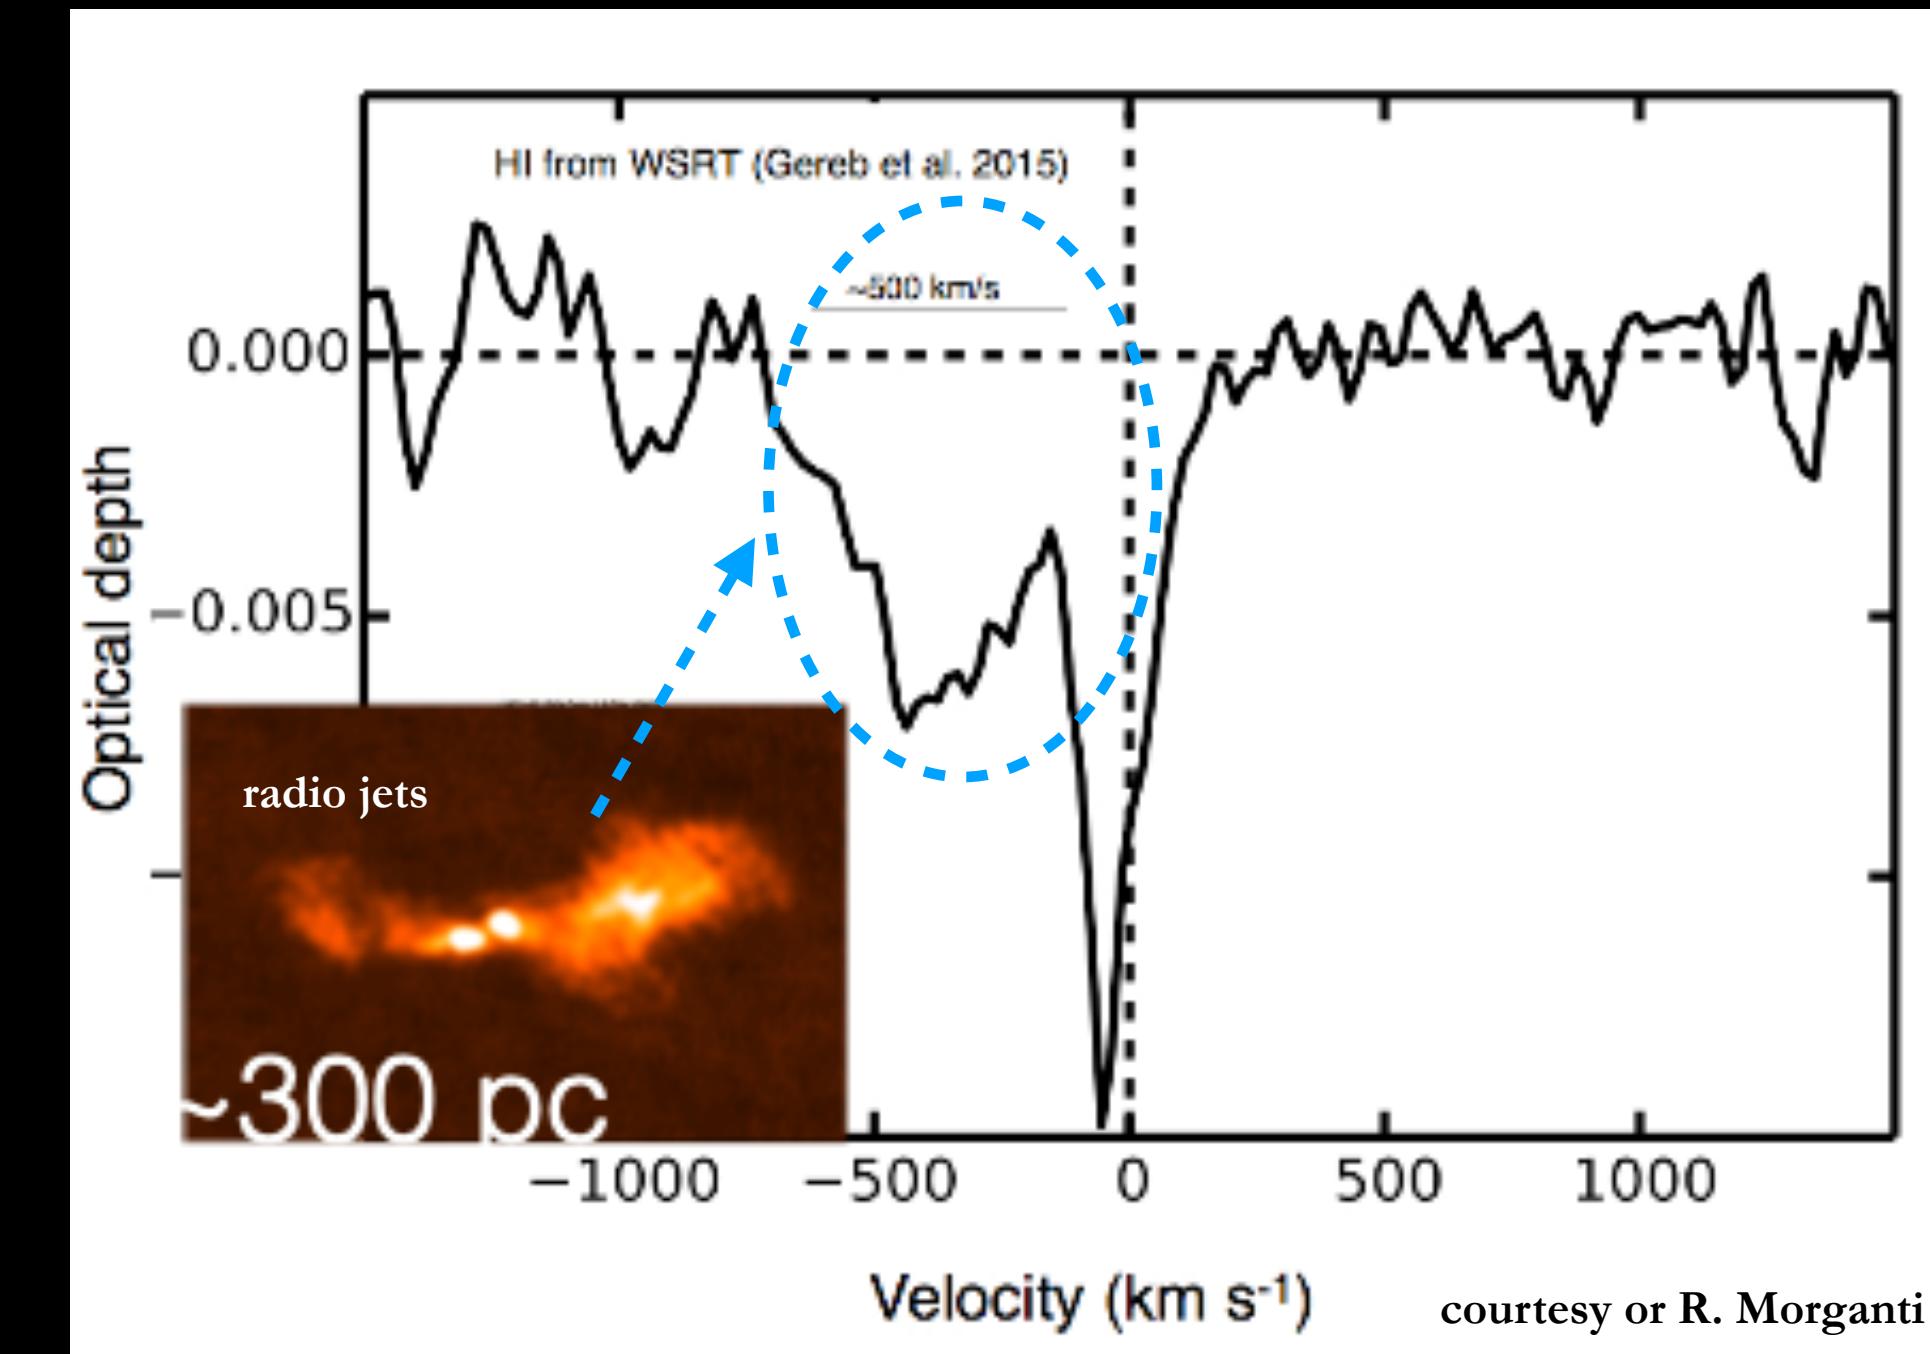

Feeding

HI & CO in-falling clouds on circum-nuclear scale

Feedback

HI outflow on circum-nuclear scale

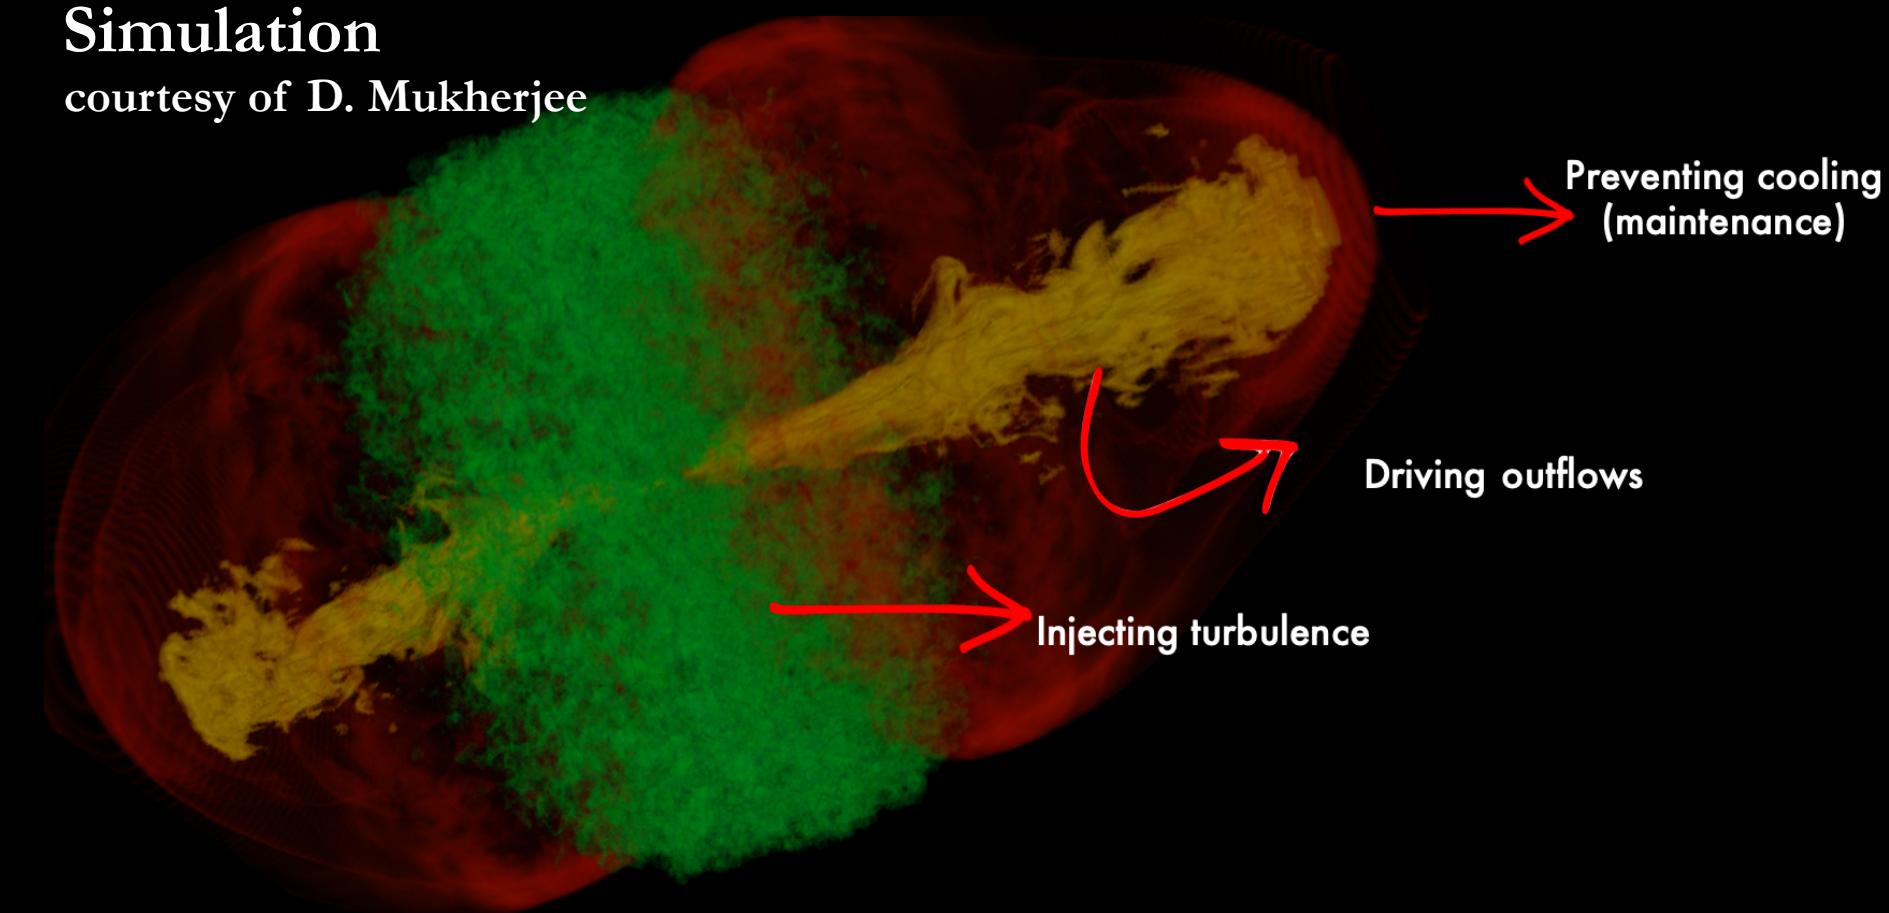

- Can we connect the gas fuelling the AGN with its duty-cycle and the interaction history of the galaxy?
- need for wide-field sensitive high resolution observations

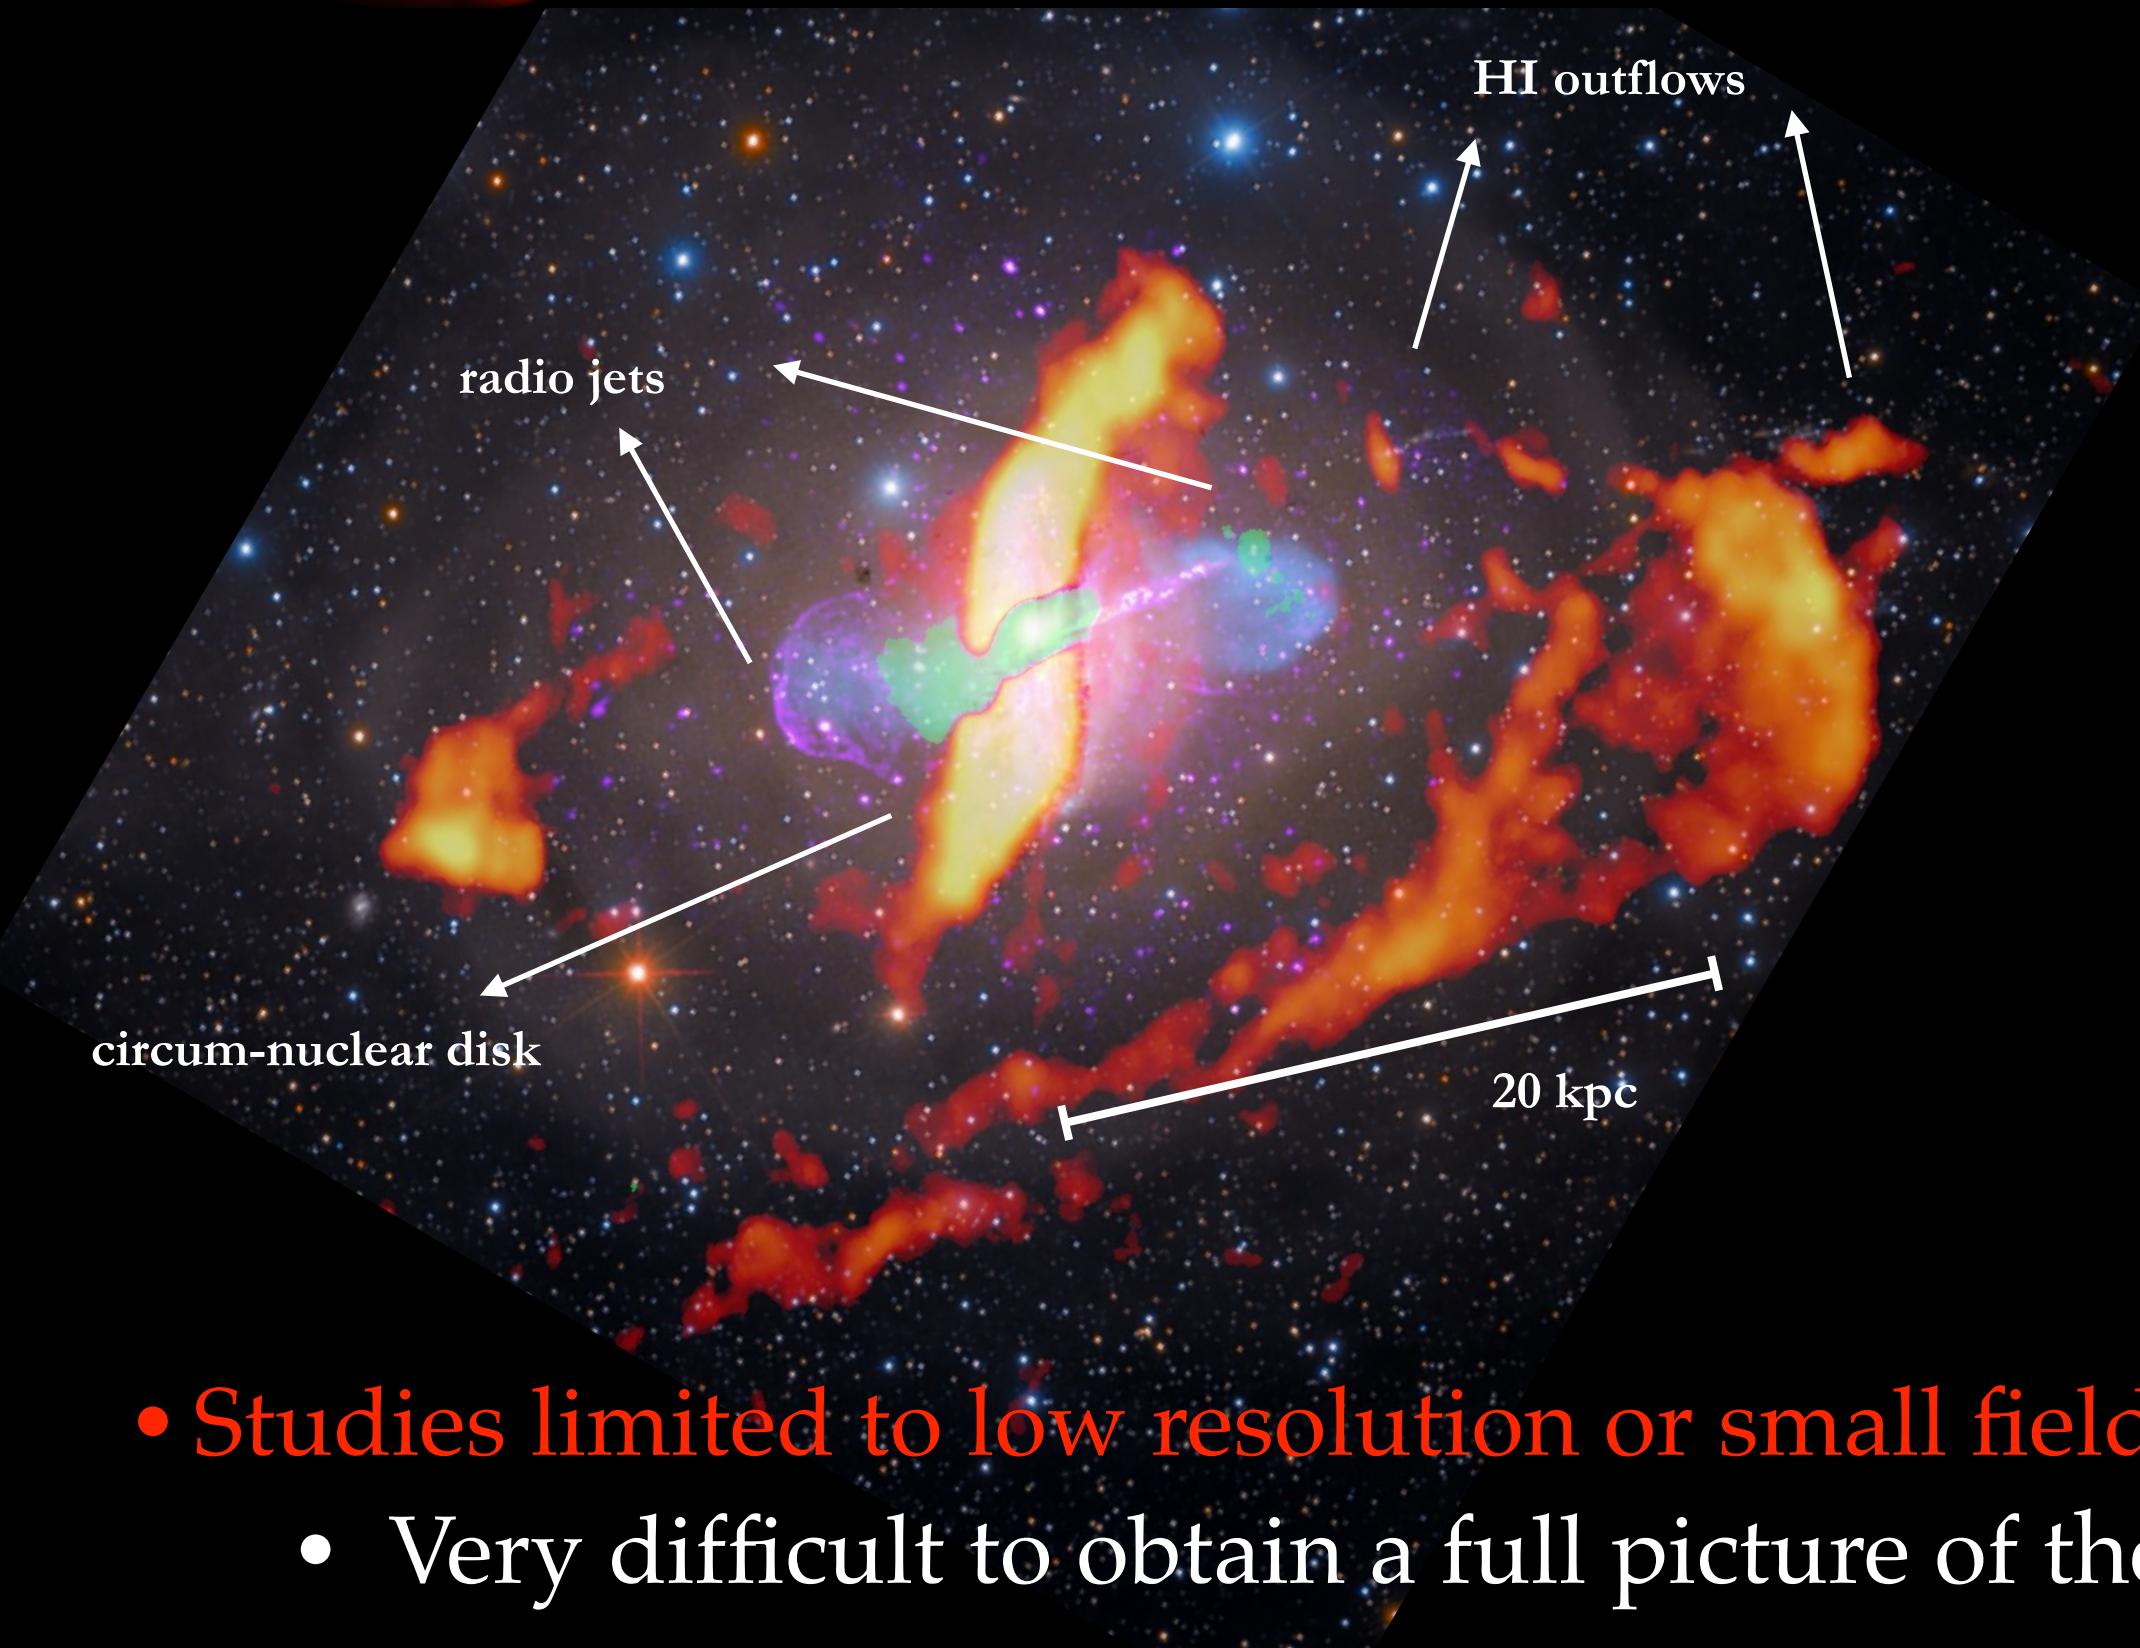

HI deep studies - AGN Feeding and Feedback

Simulation

courtesy of D. Mukherjee

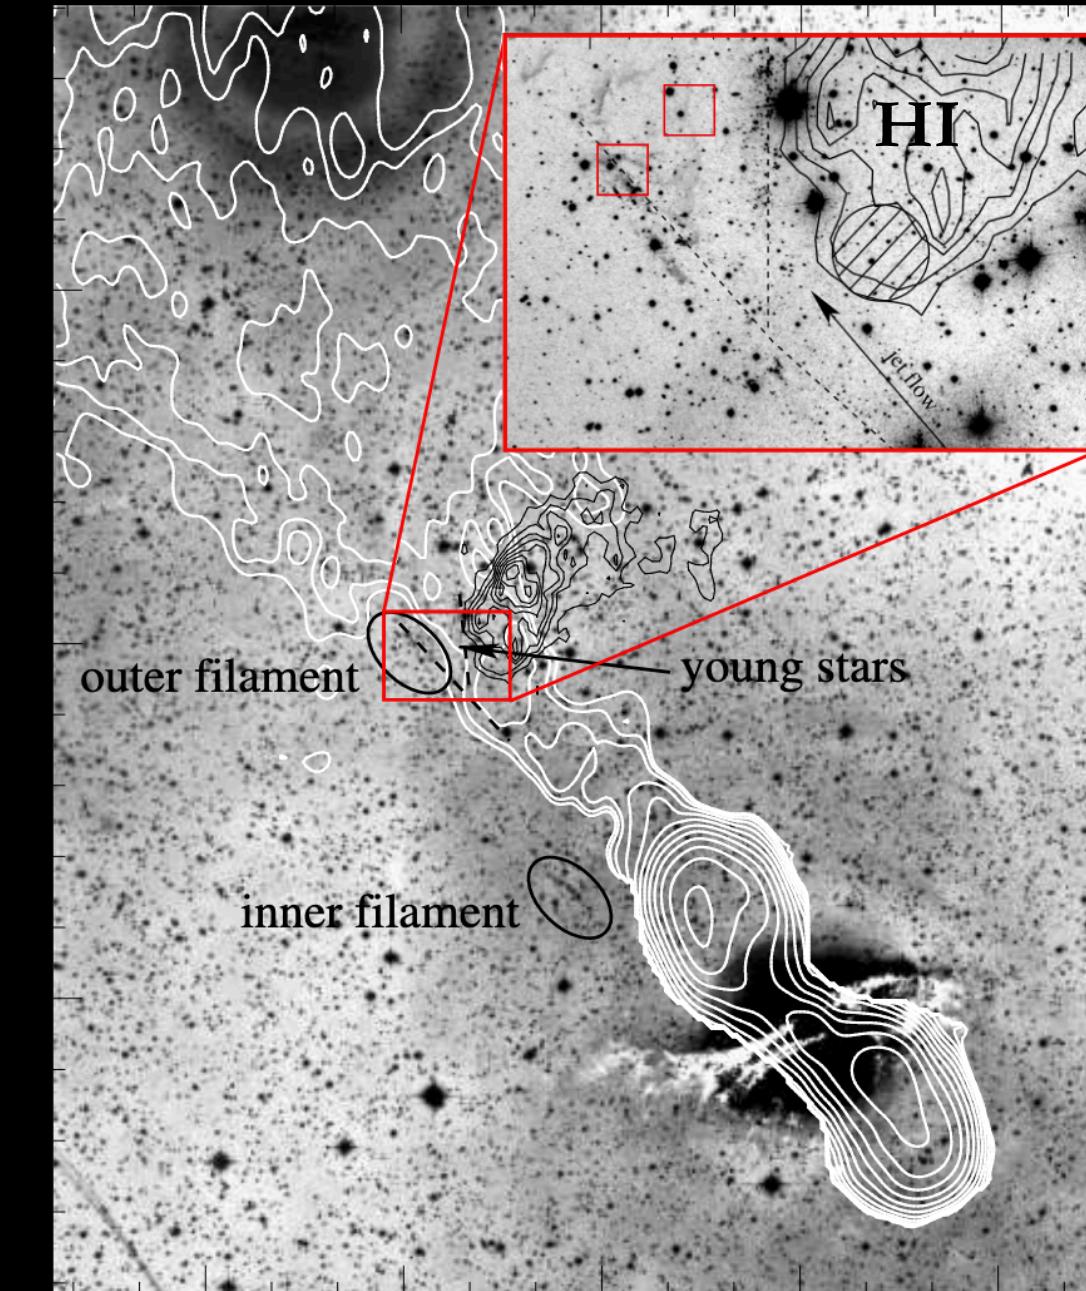

- AGN-jets eject, displace, shock, and heat the gas from the ISM into the IGM
- Prevent further cooling and quench SF?
- Enhance SF in particular regions at the outskirts of galaxies

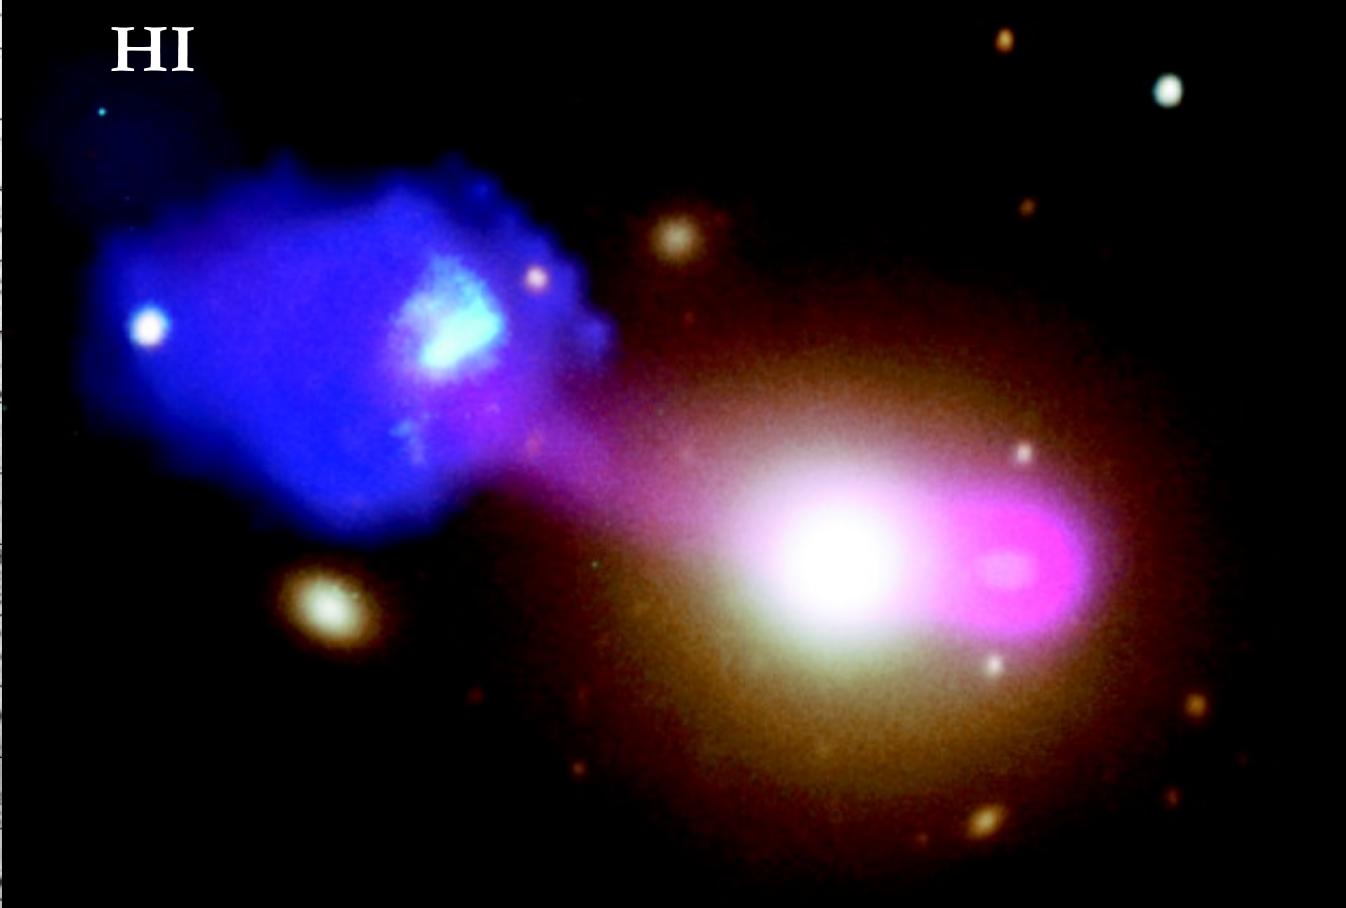

- Studies limited to low resolution or small field of view

- Very difficult to obtain a full picture of the AGN and its environment

Centaurus A [Santoro et al. 2016]

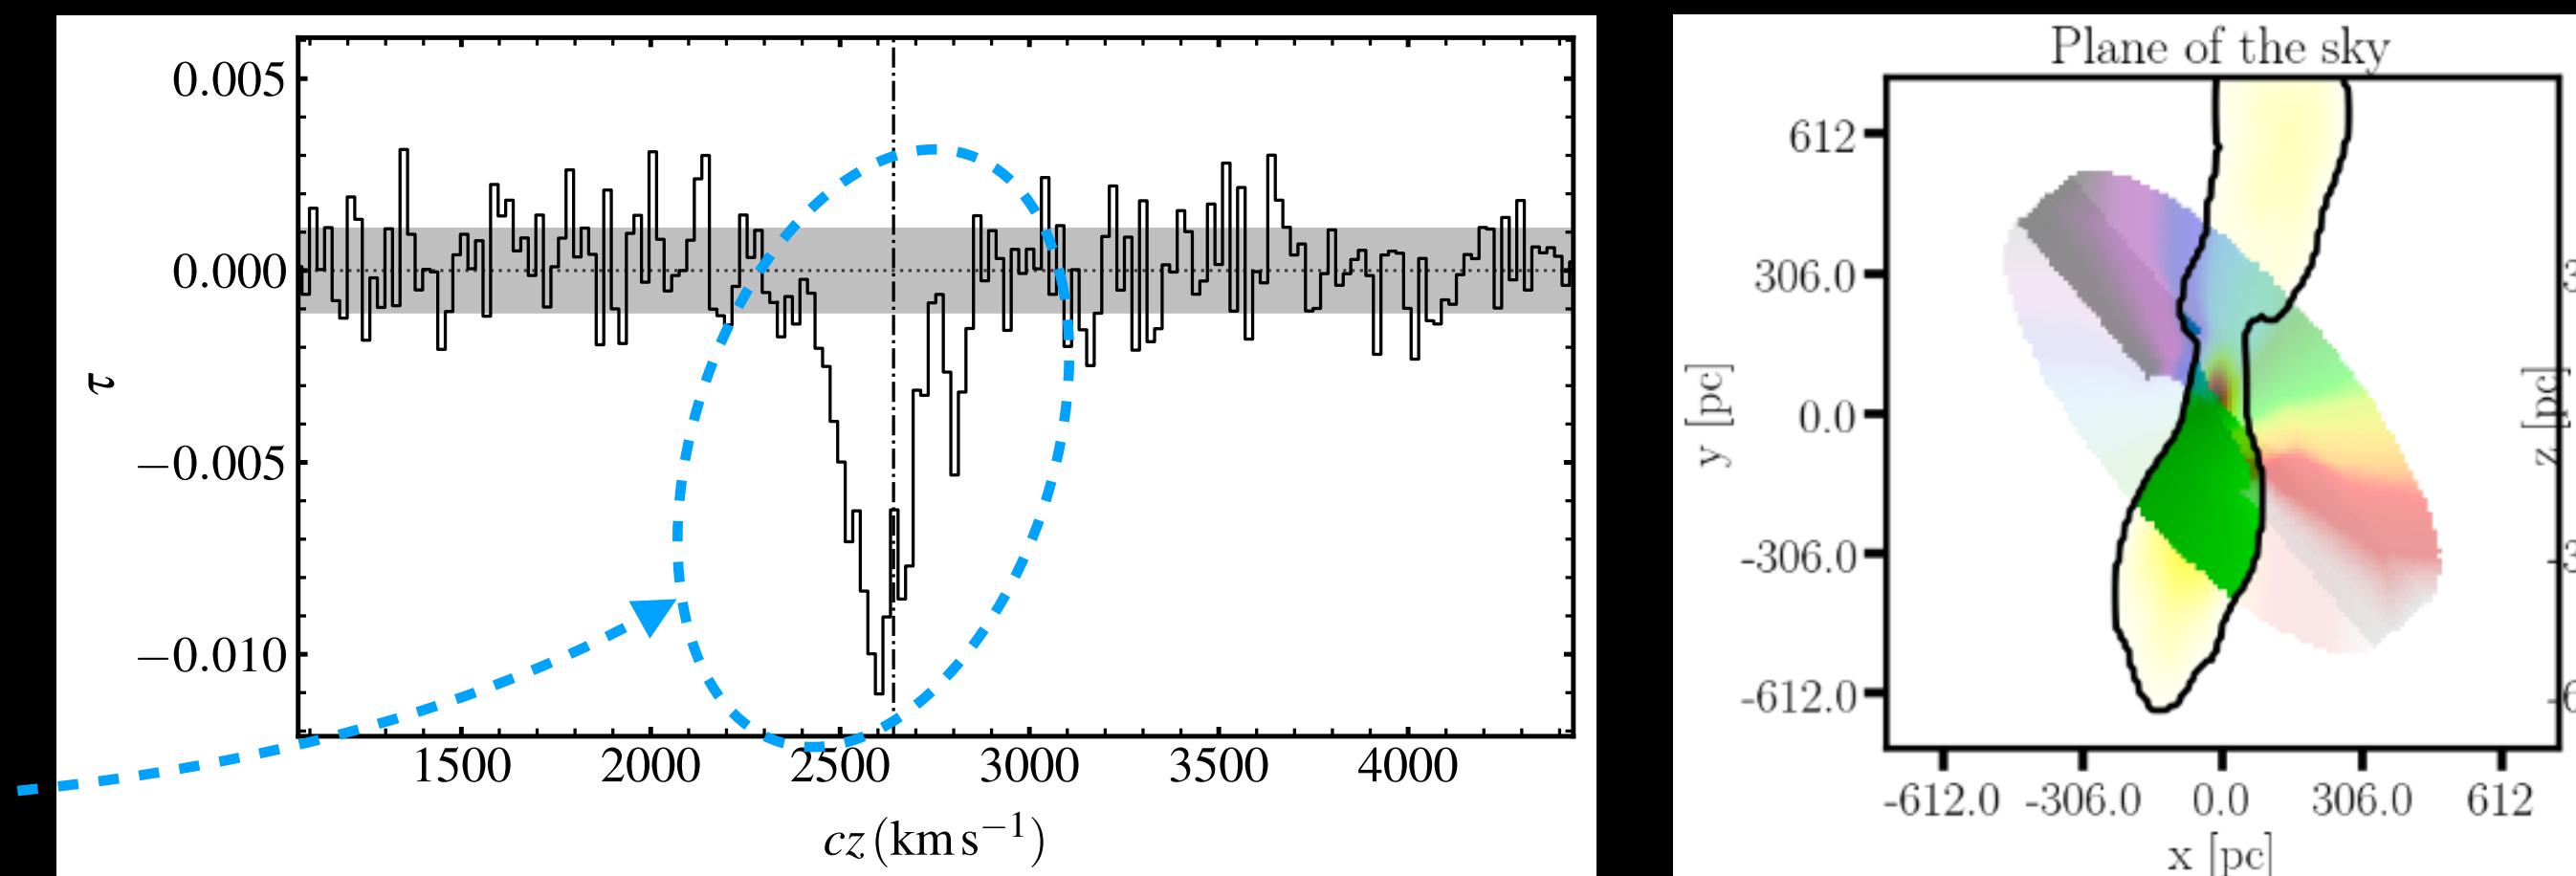

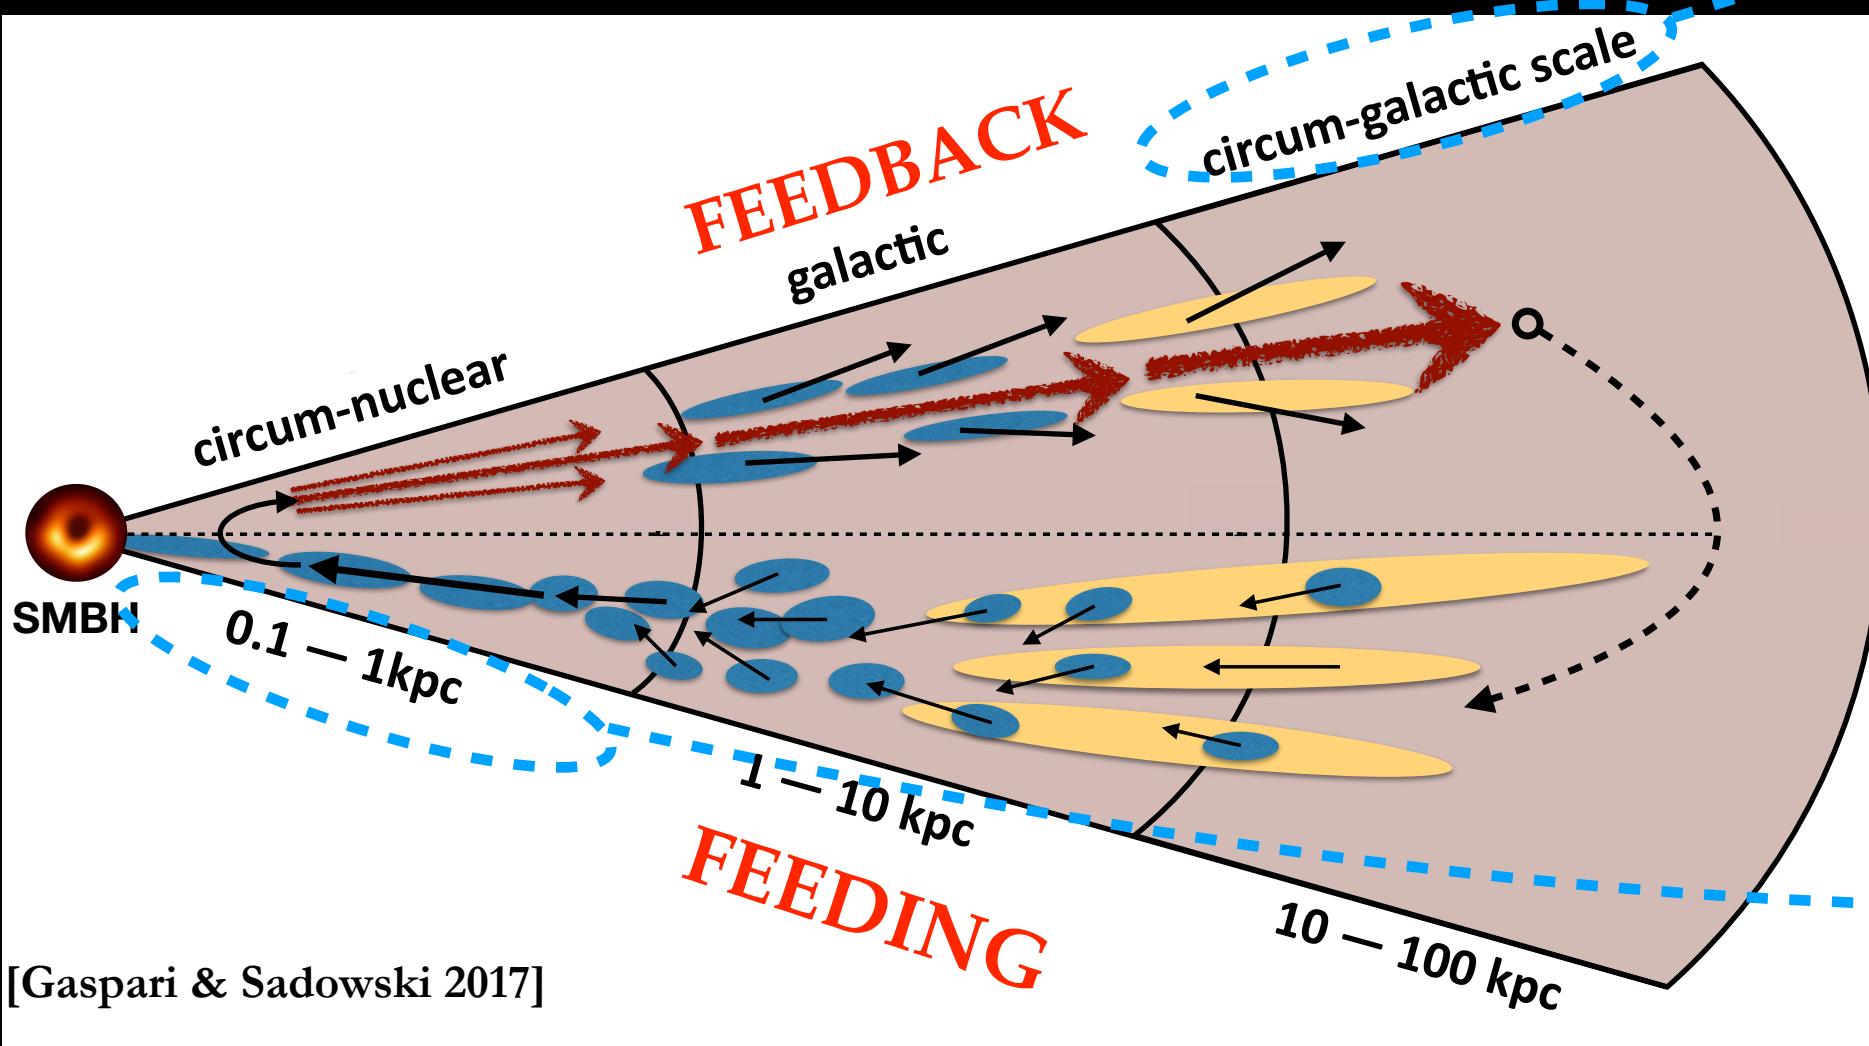

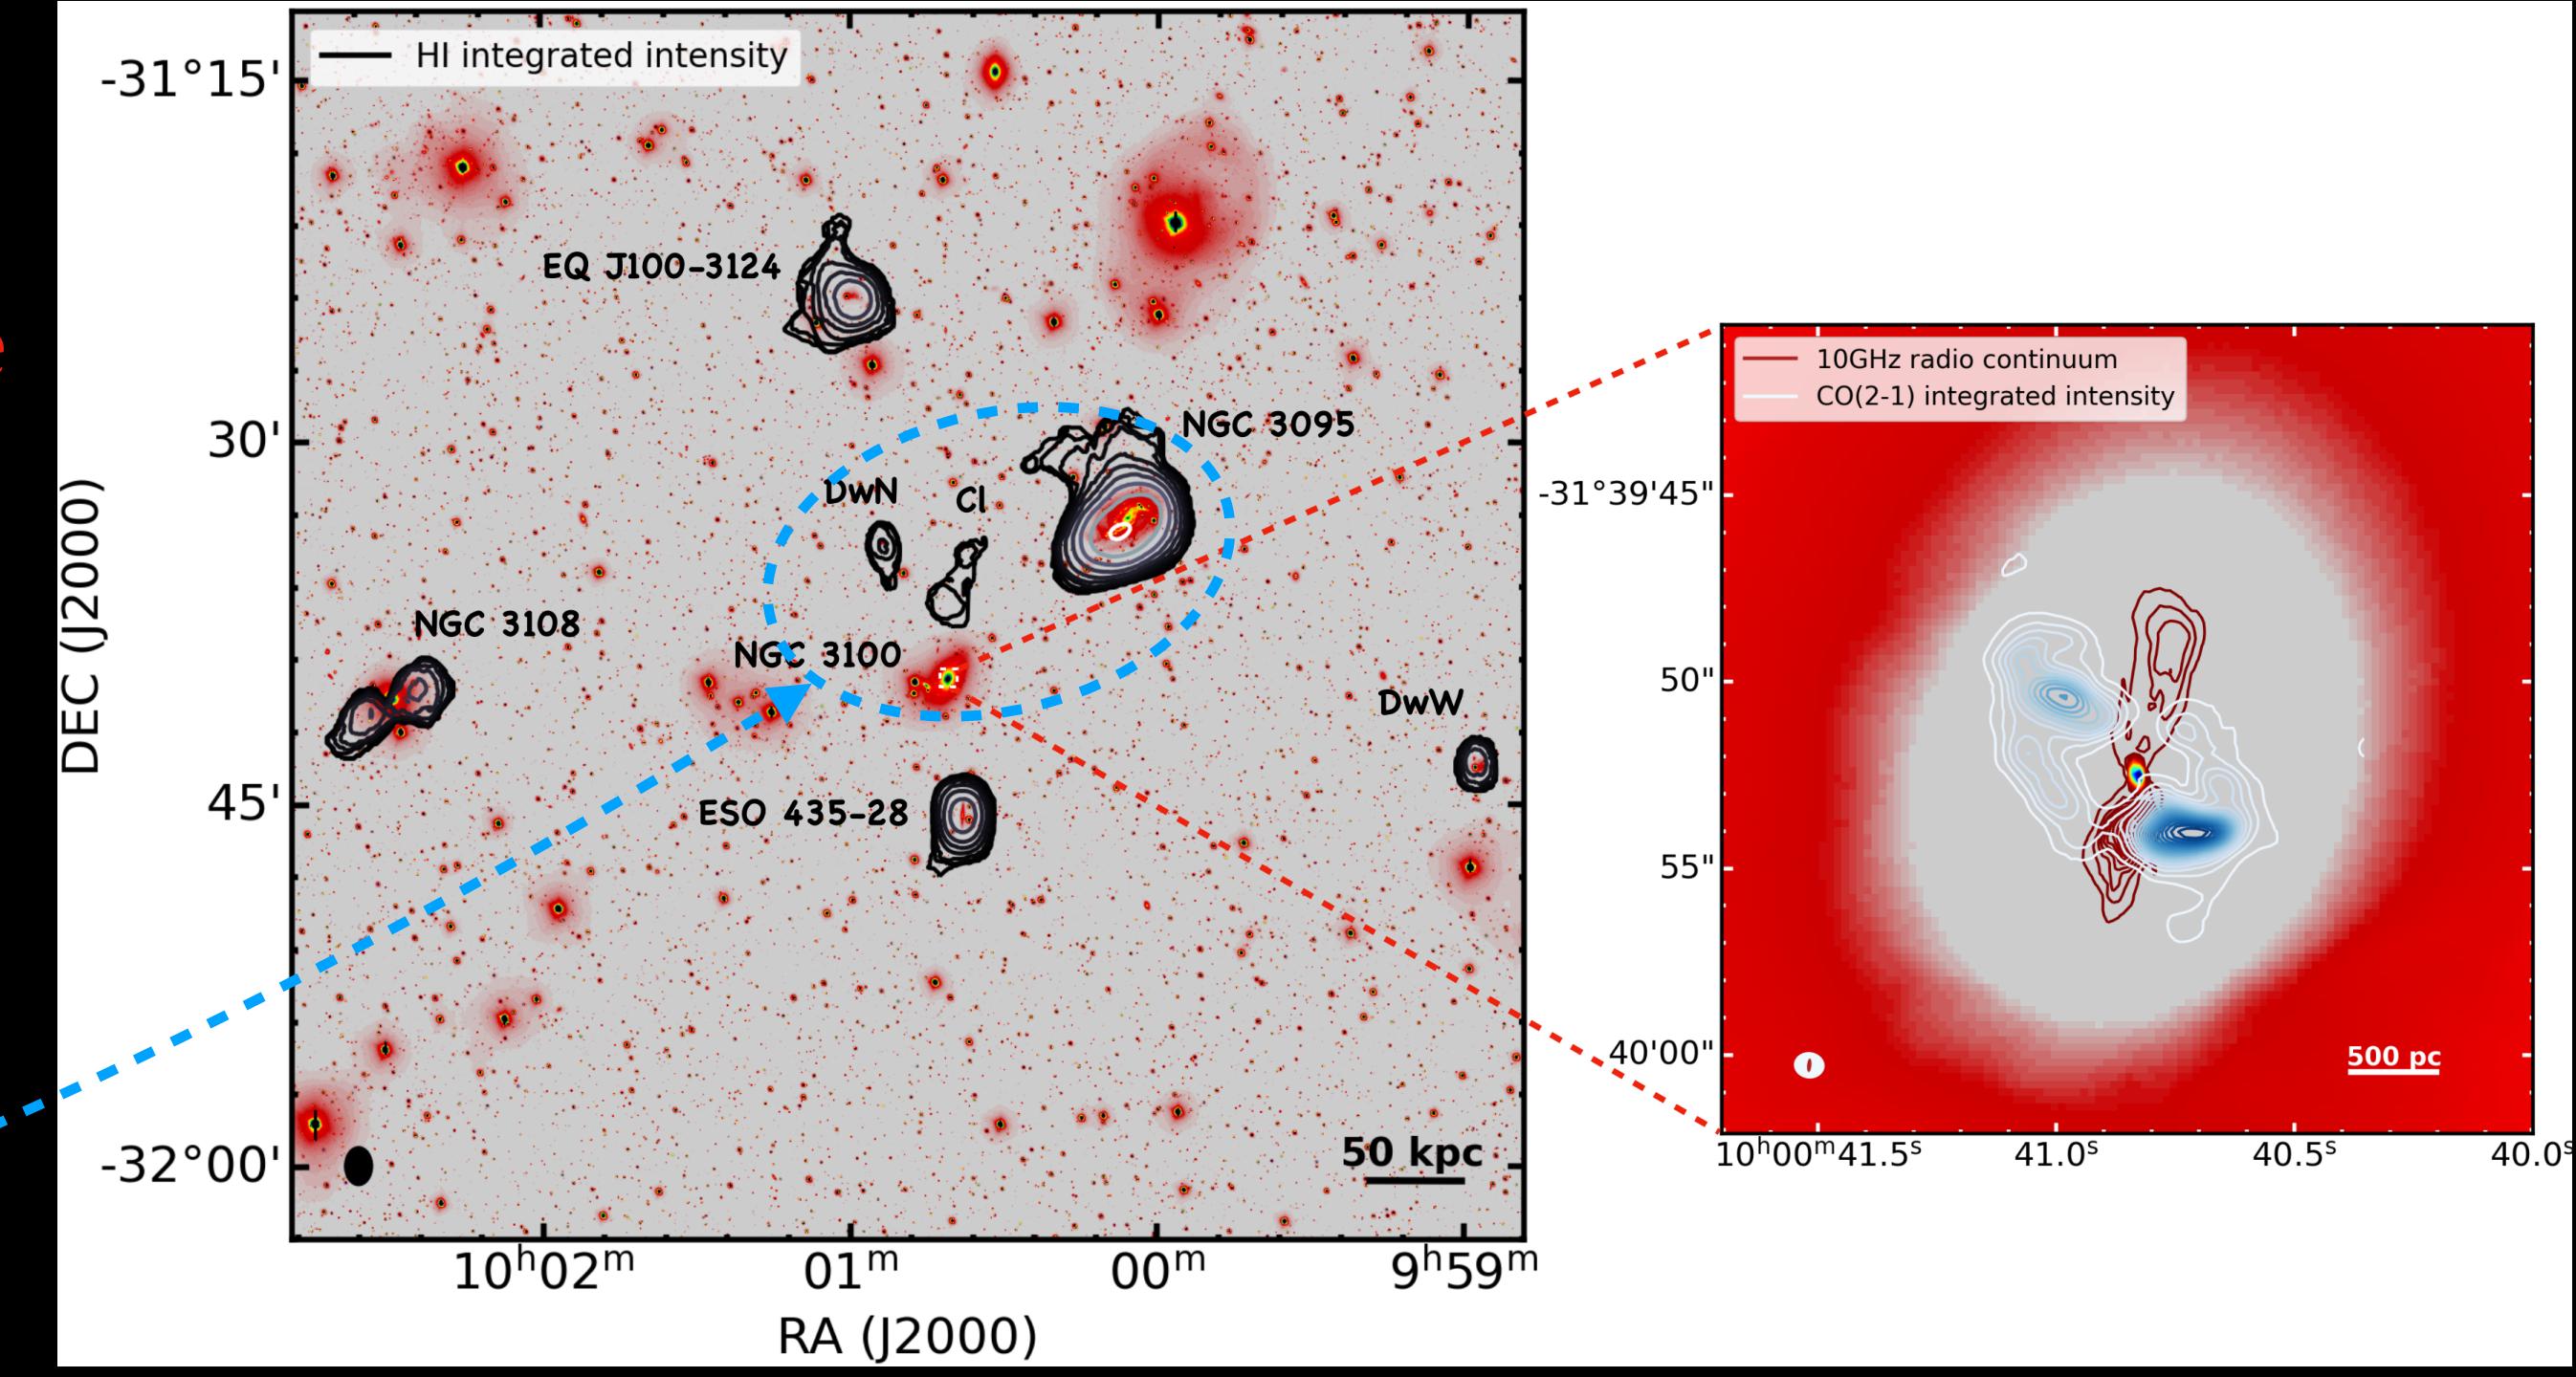

Mikowski object [Croft et al. 2006]

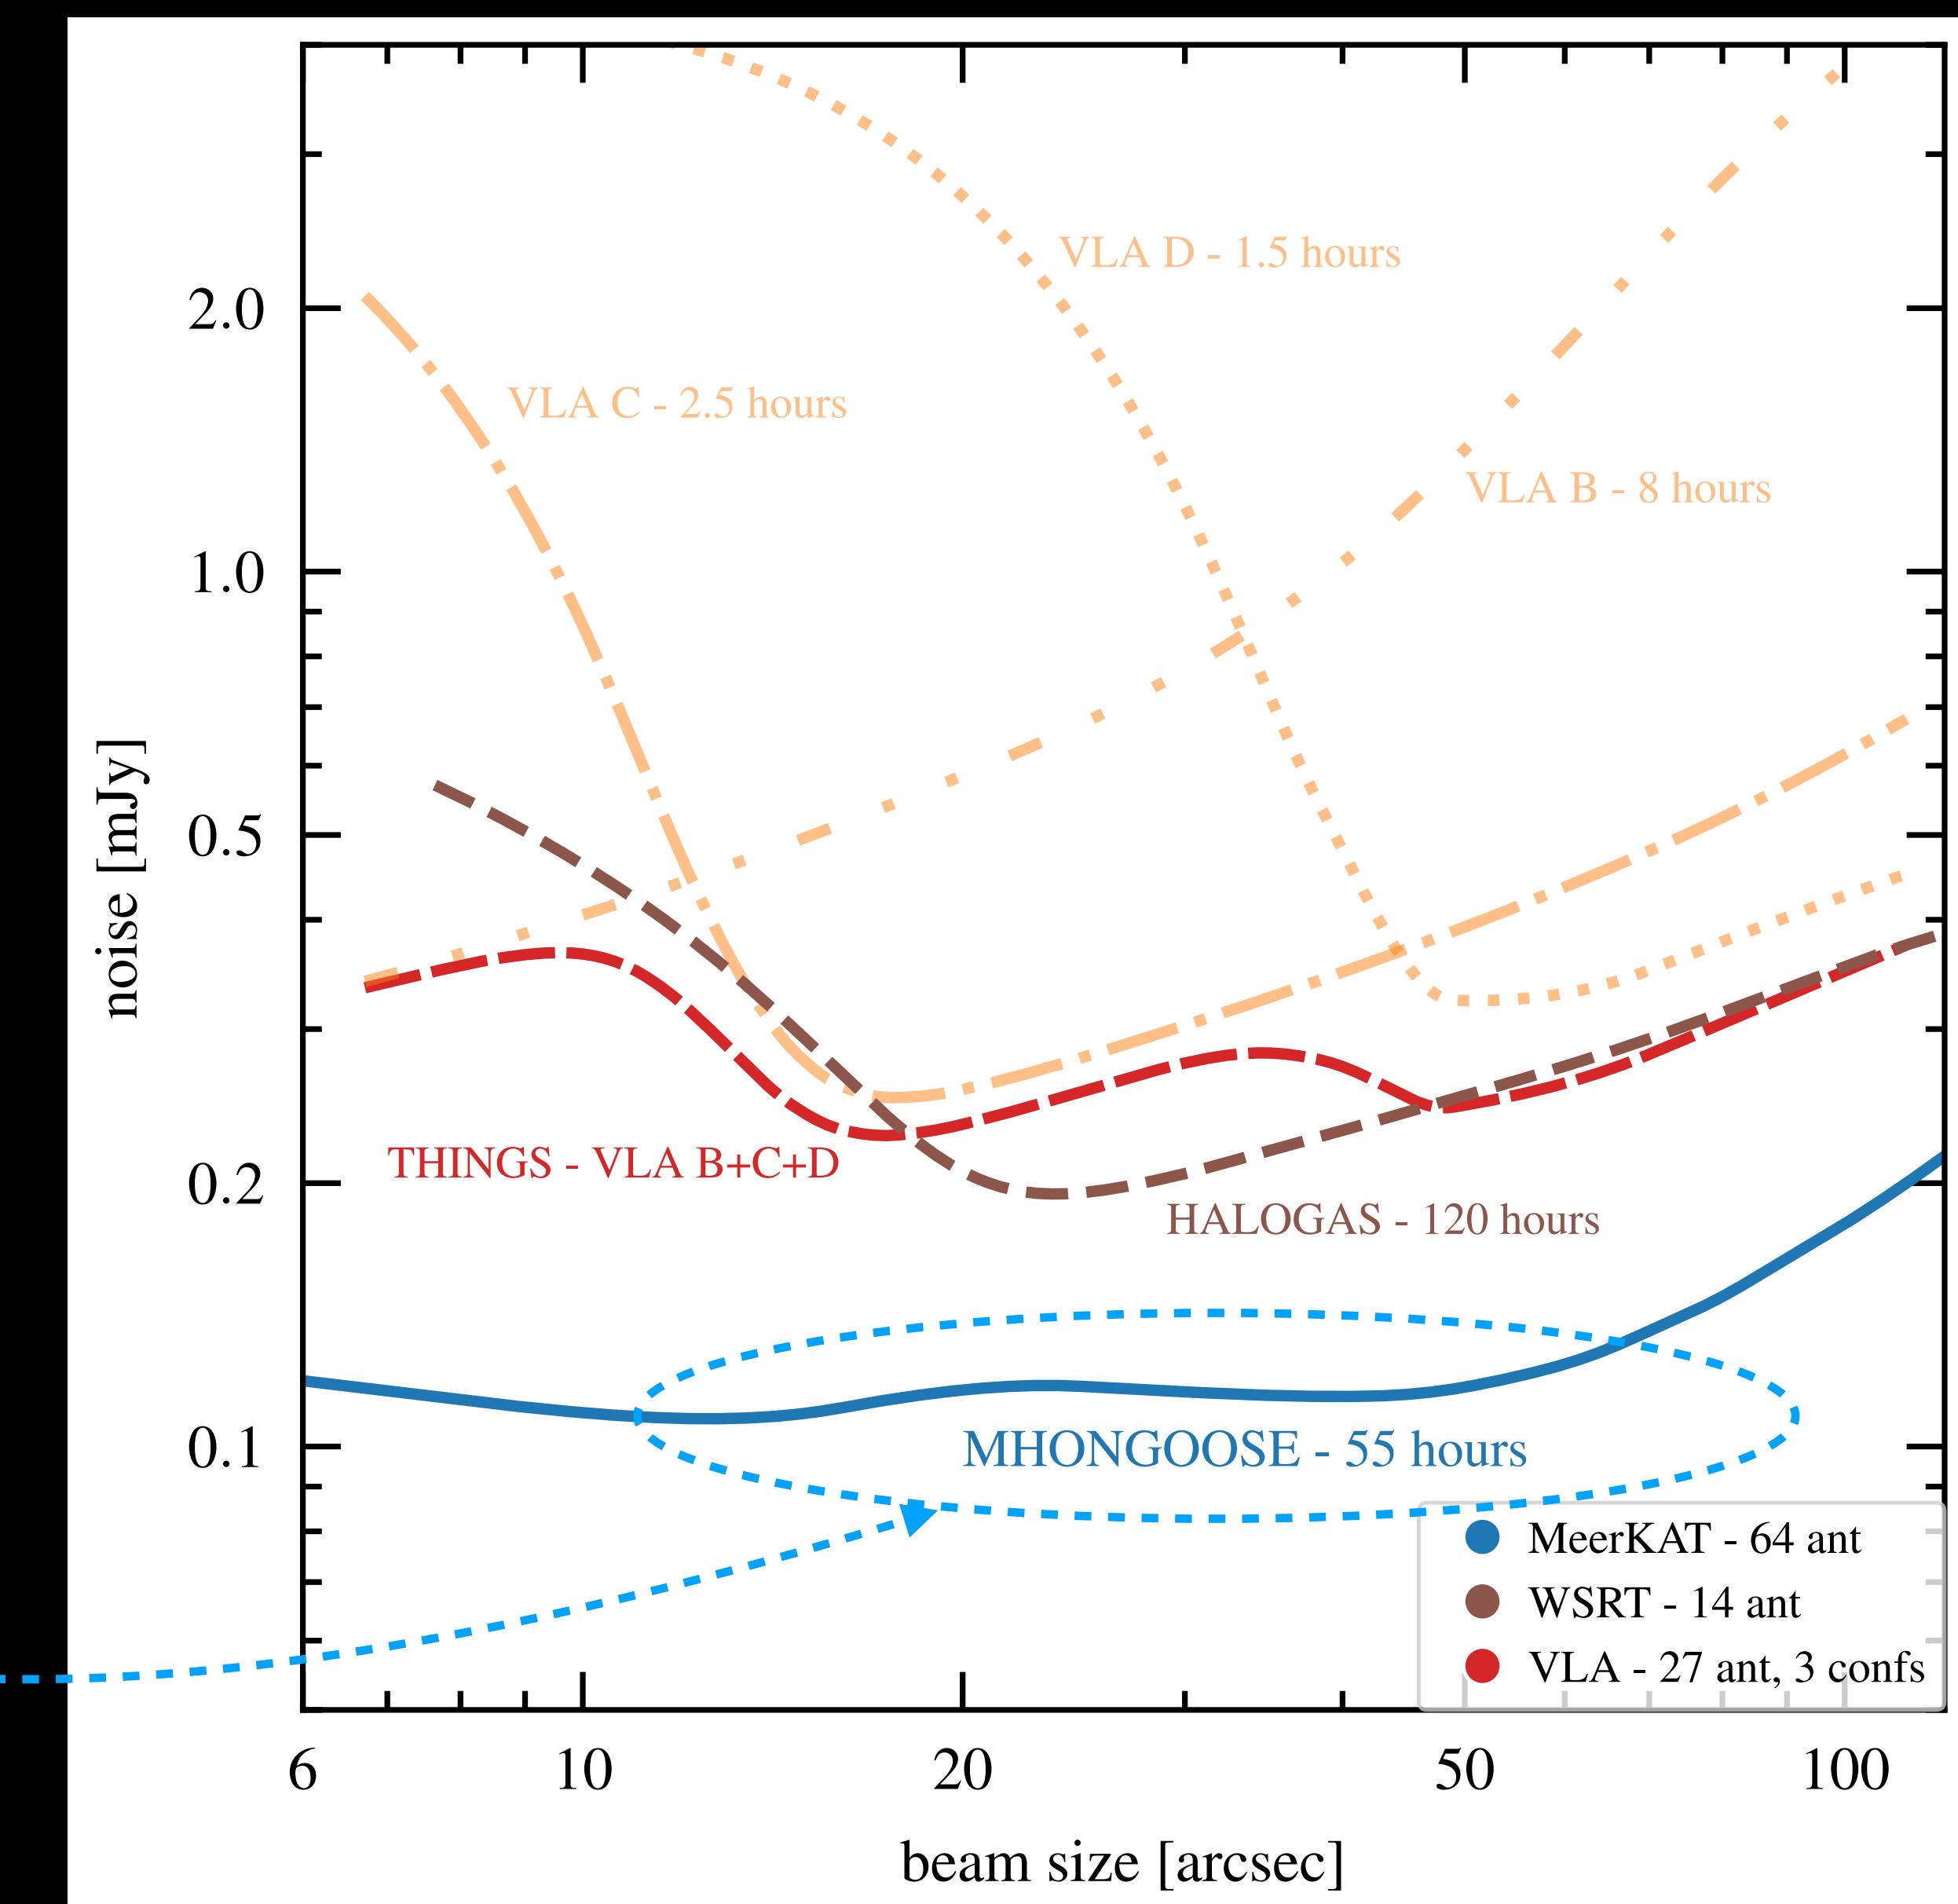

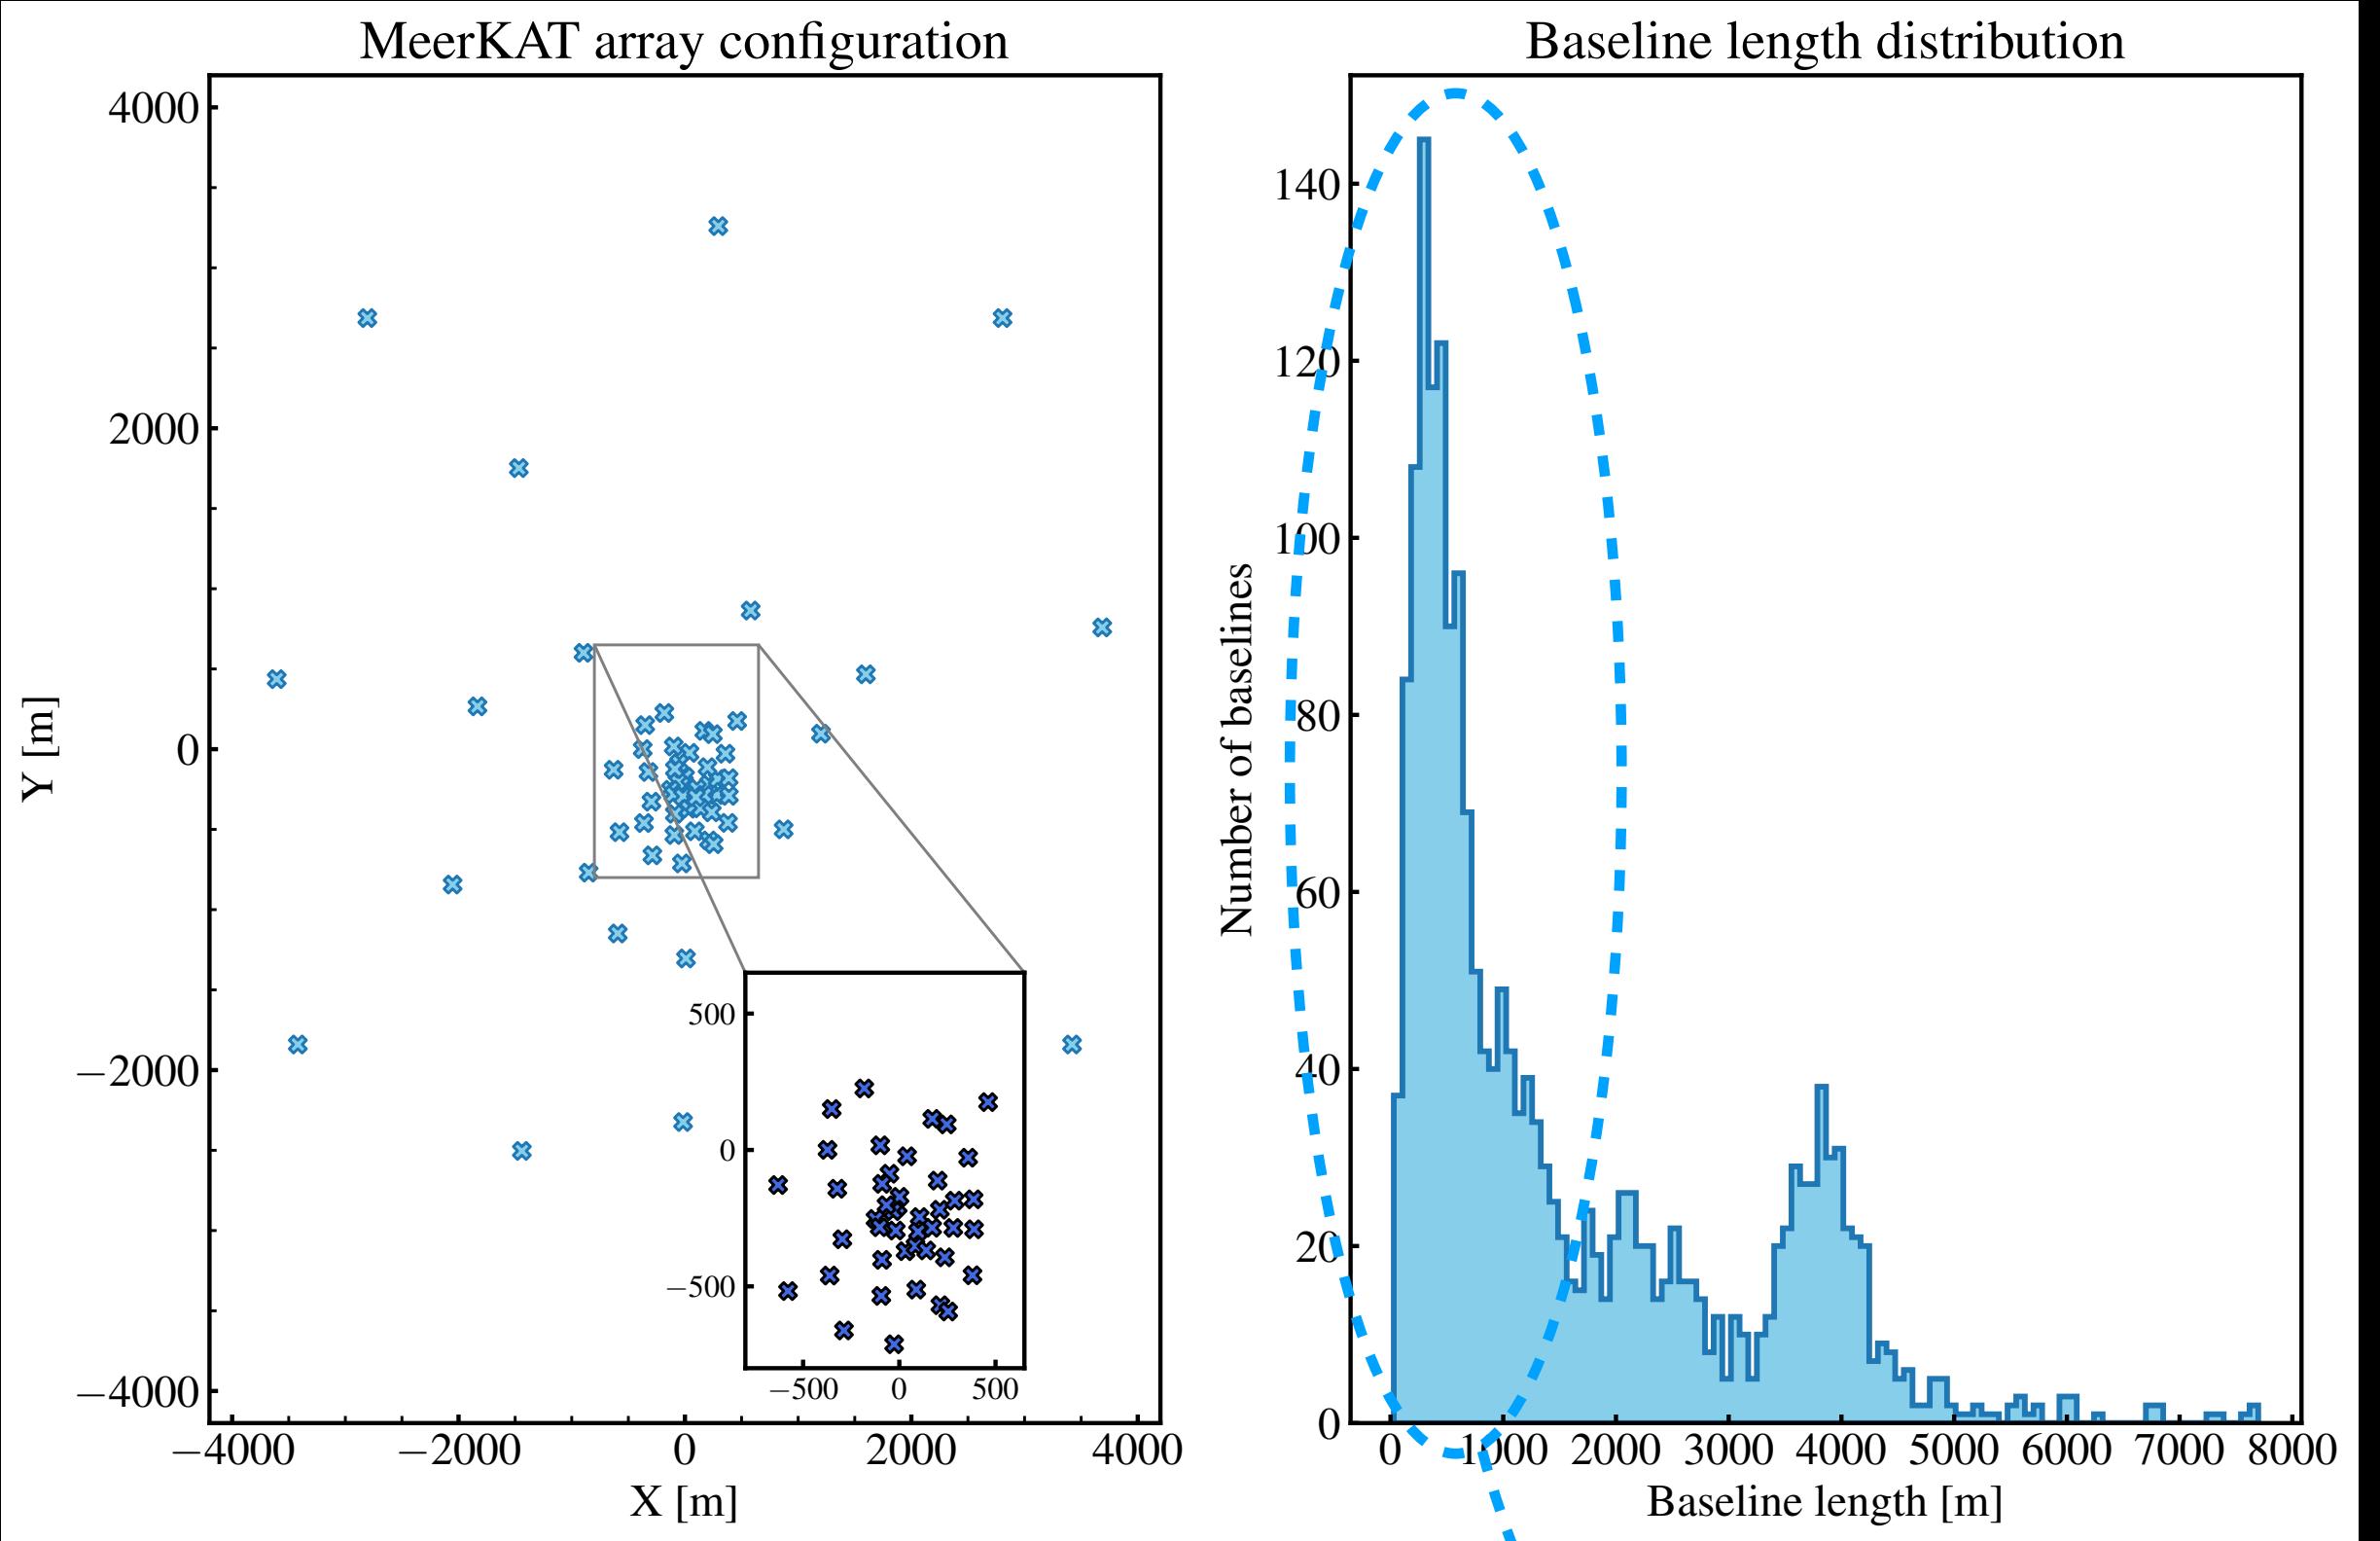

HI in AGN before MeerKAT - NGC3100 with ATCA

- NGC3100 Radio loud nearby ETG [Maccagni et al., submitted]
- 36hrs ATCA + deep photometry VEGAS [Iodice et al. 2019]
 - HI from the circum-nuclear to circum-galactic scale
- $3\sigma N(\text{HI}) \text{ cm}^{-2}$ @ $90''$: $< 1 \times 10^{19} \text{ cm}^{-2}$
- HI emission \rightarrow interaction history of the group
 - A 'dark' HI cloud falls into the ETG
- HI absorption
 - multi-phase circum-nuclear disk & non-rotating red-shifted gas

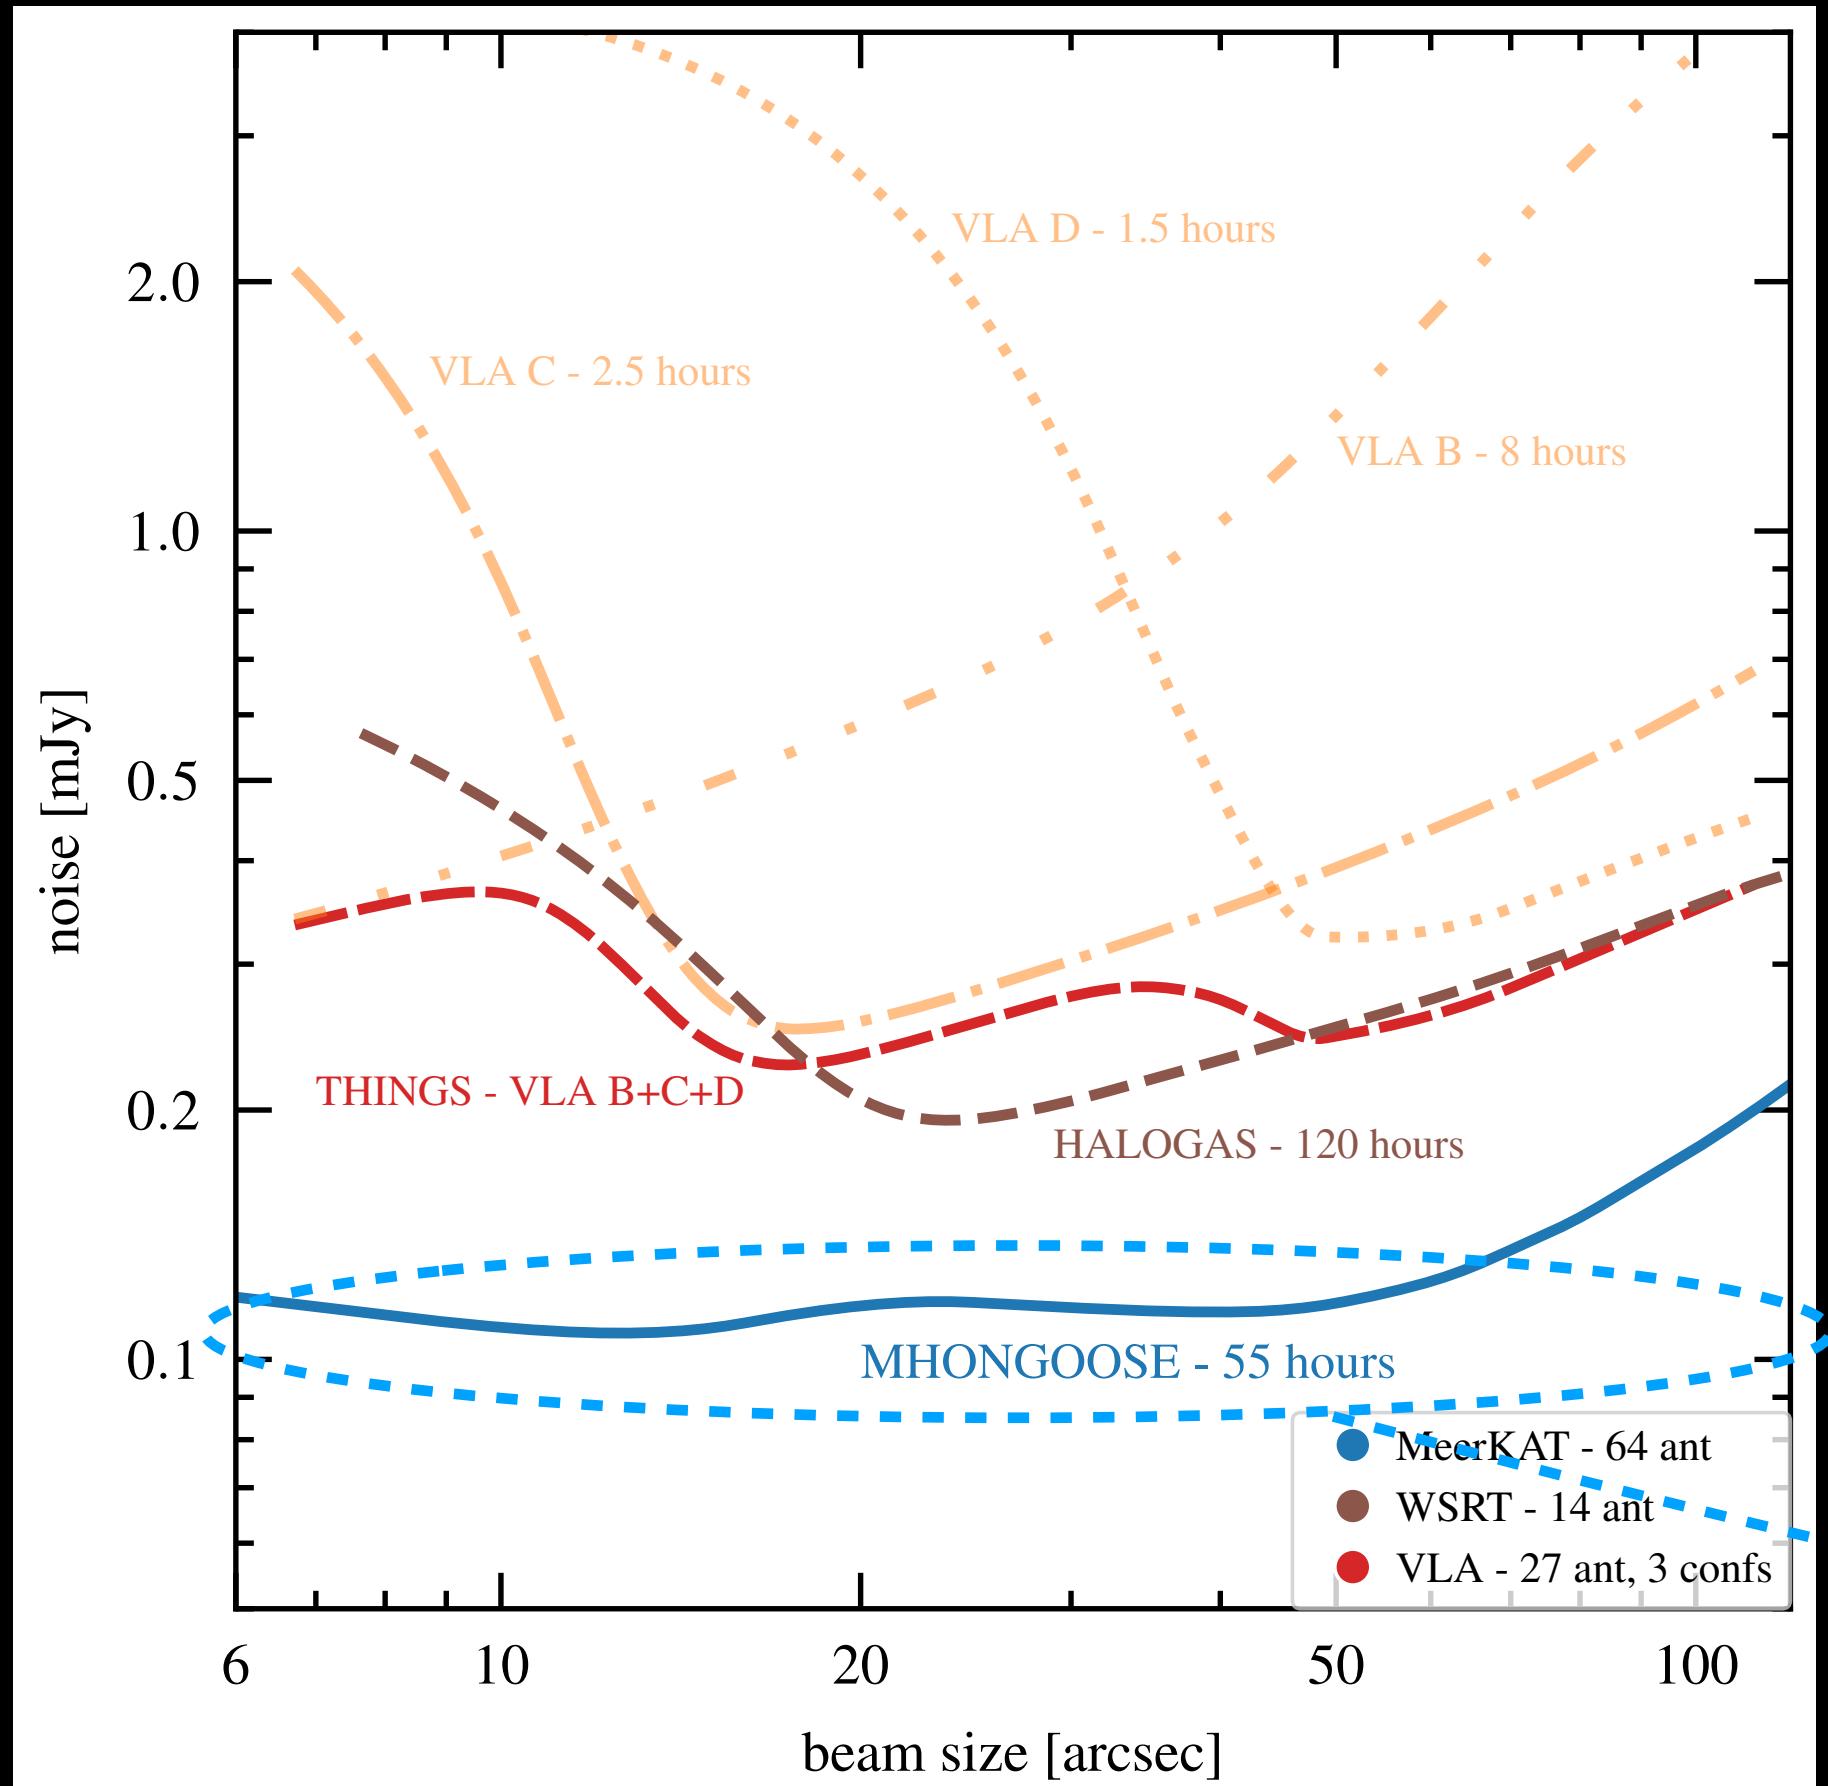

MeerKAT - a dense core of antennas

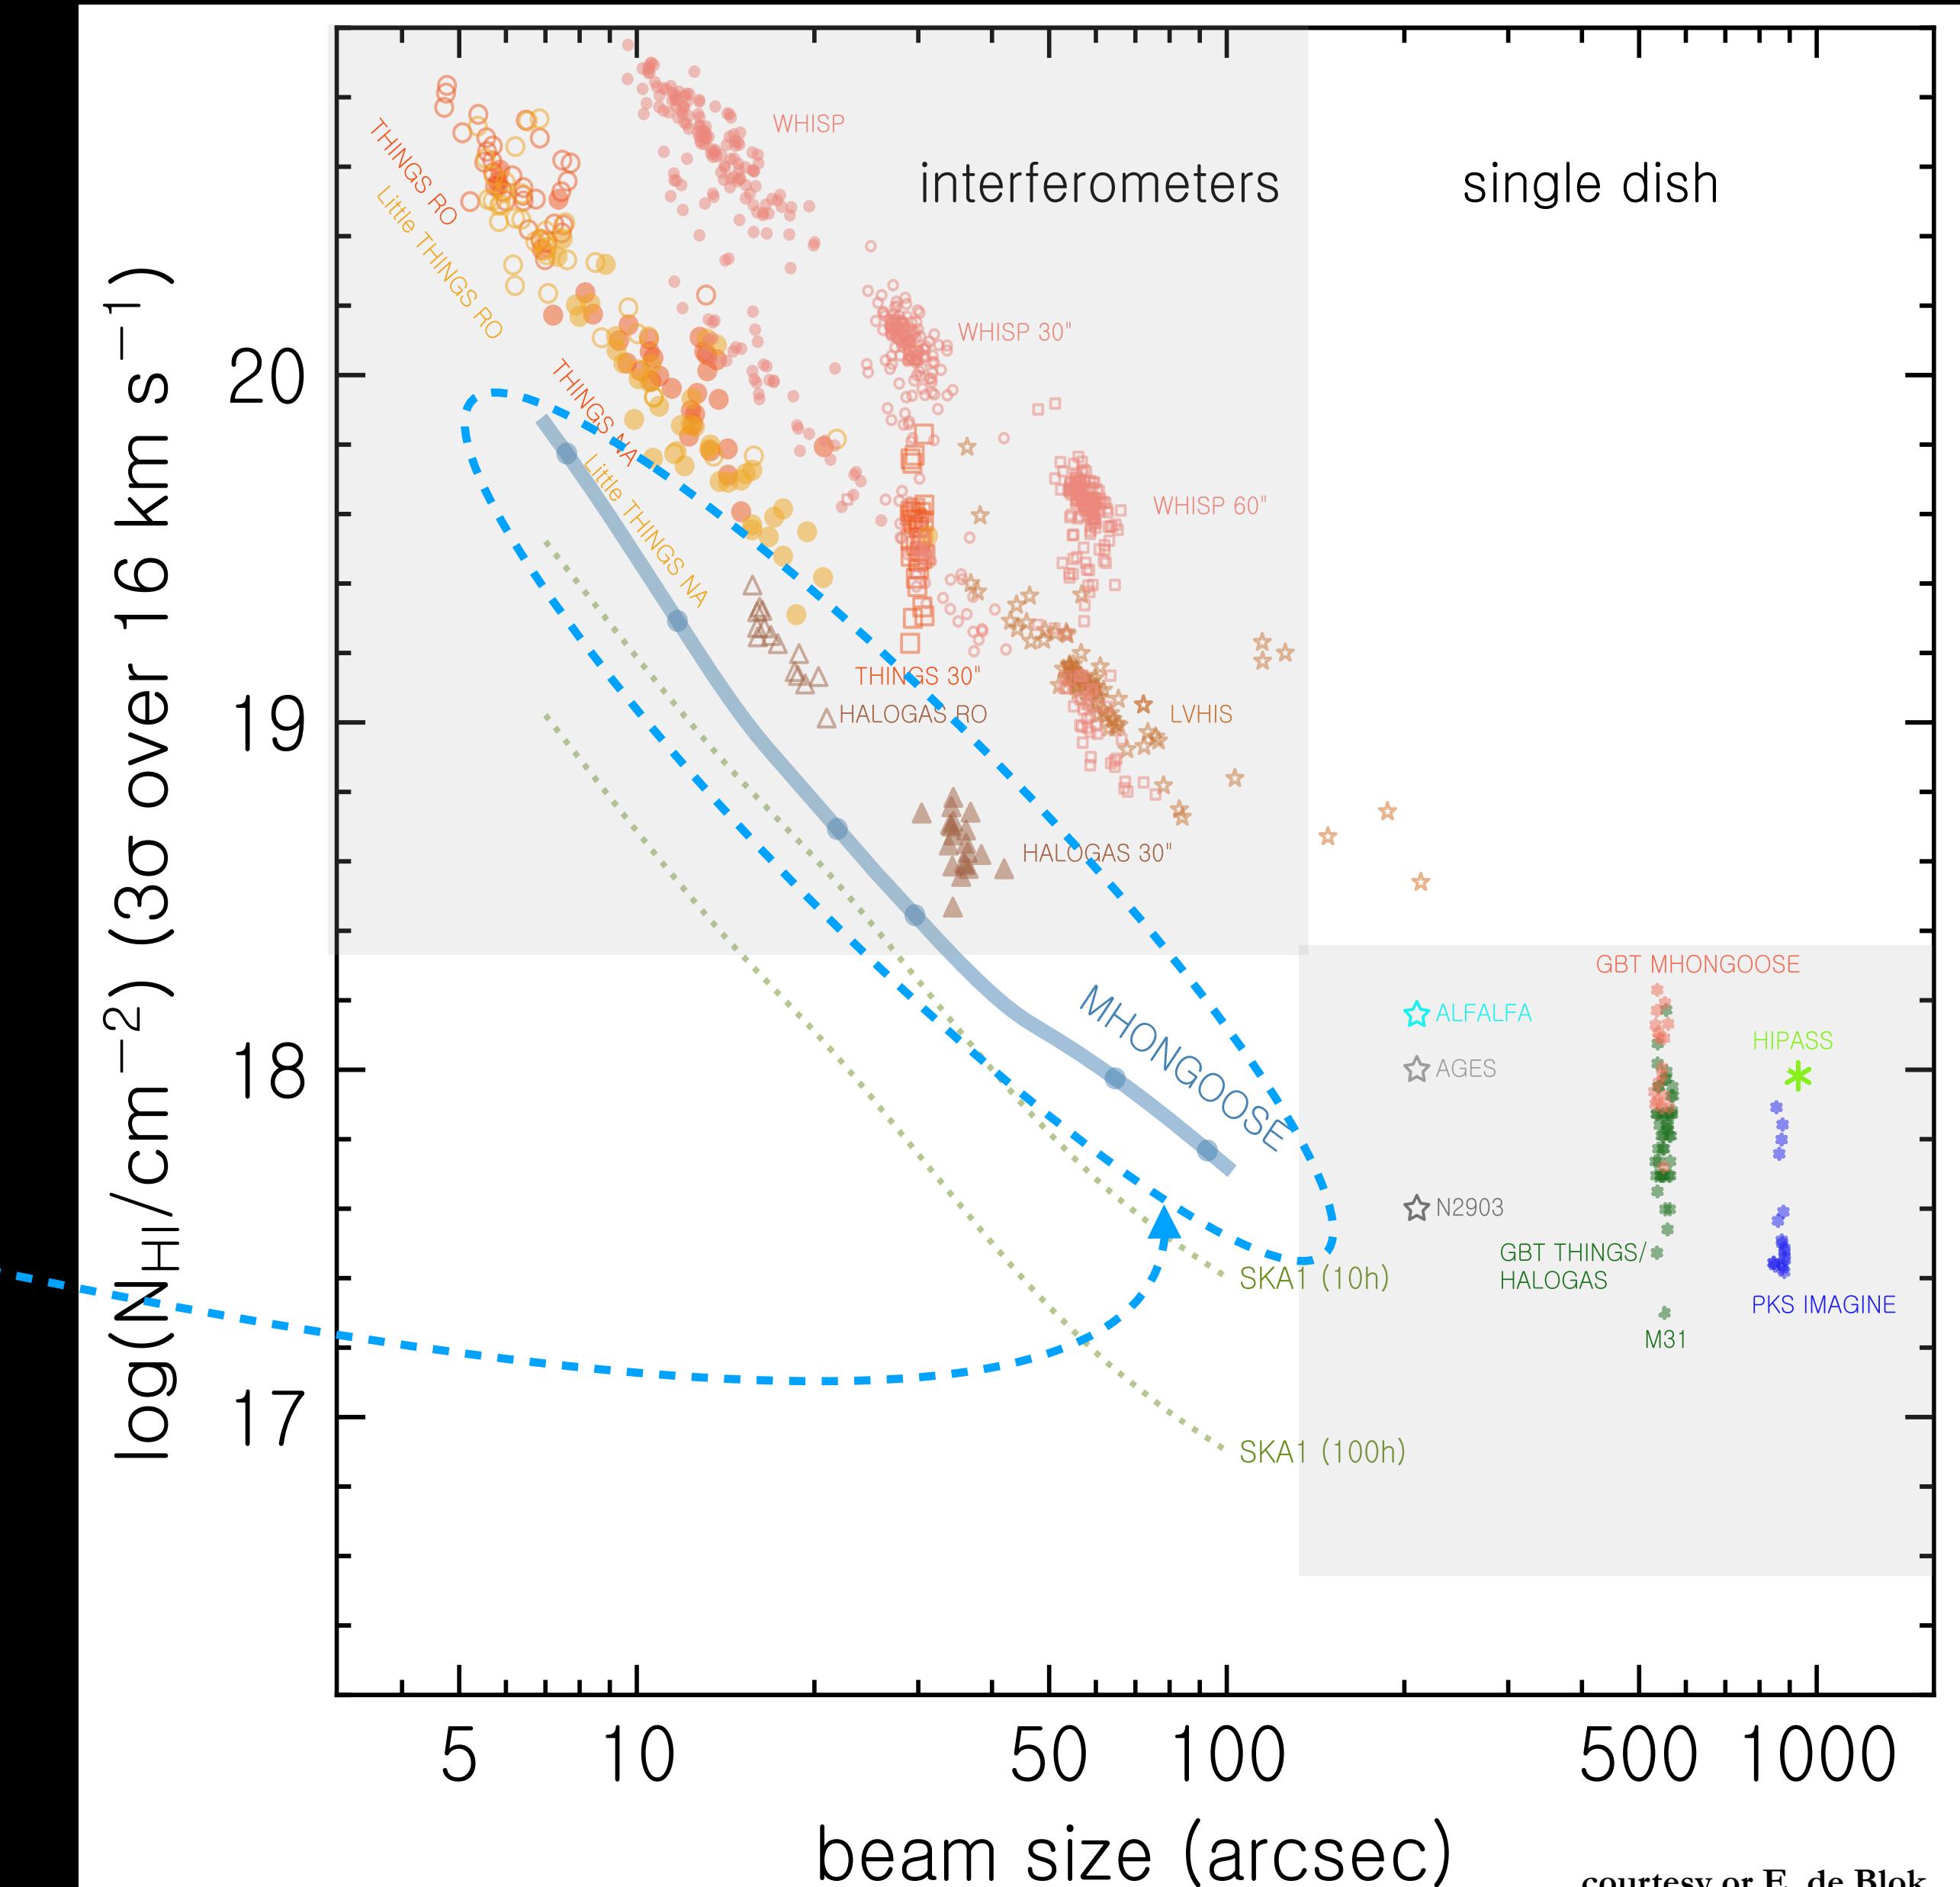

MeerKAT's dense core of antennas guarantees
constant sensitivity over all scales

MeerKAT - constant sensitivity on all scales

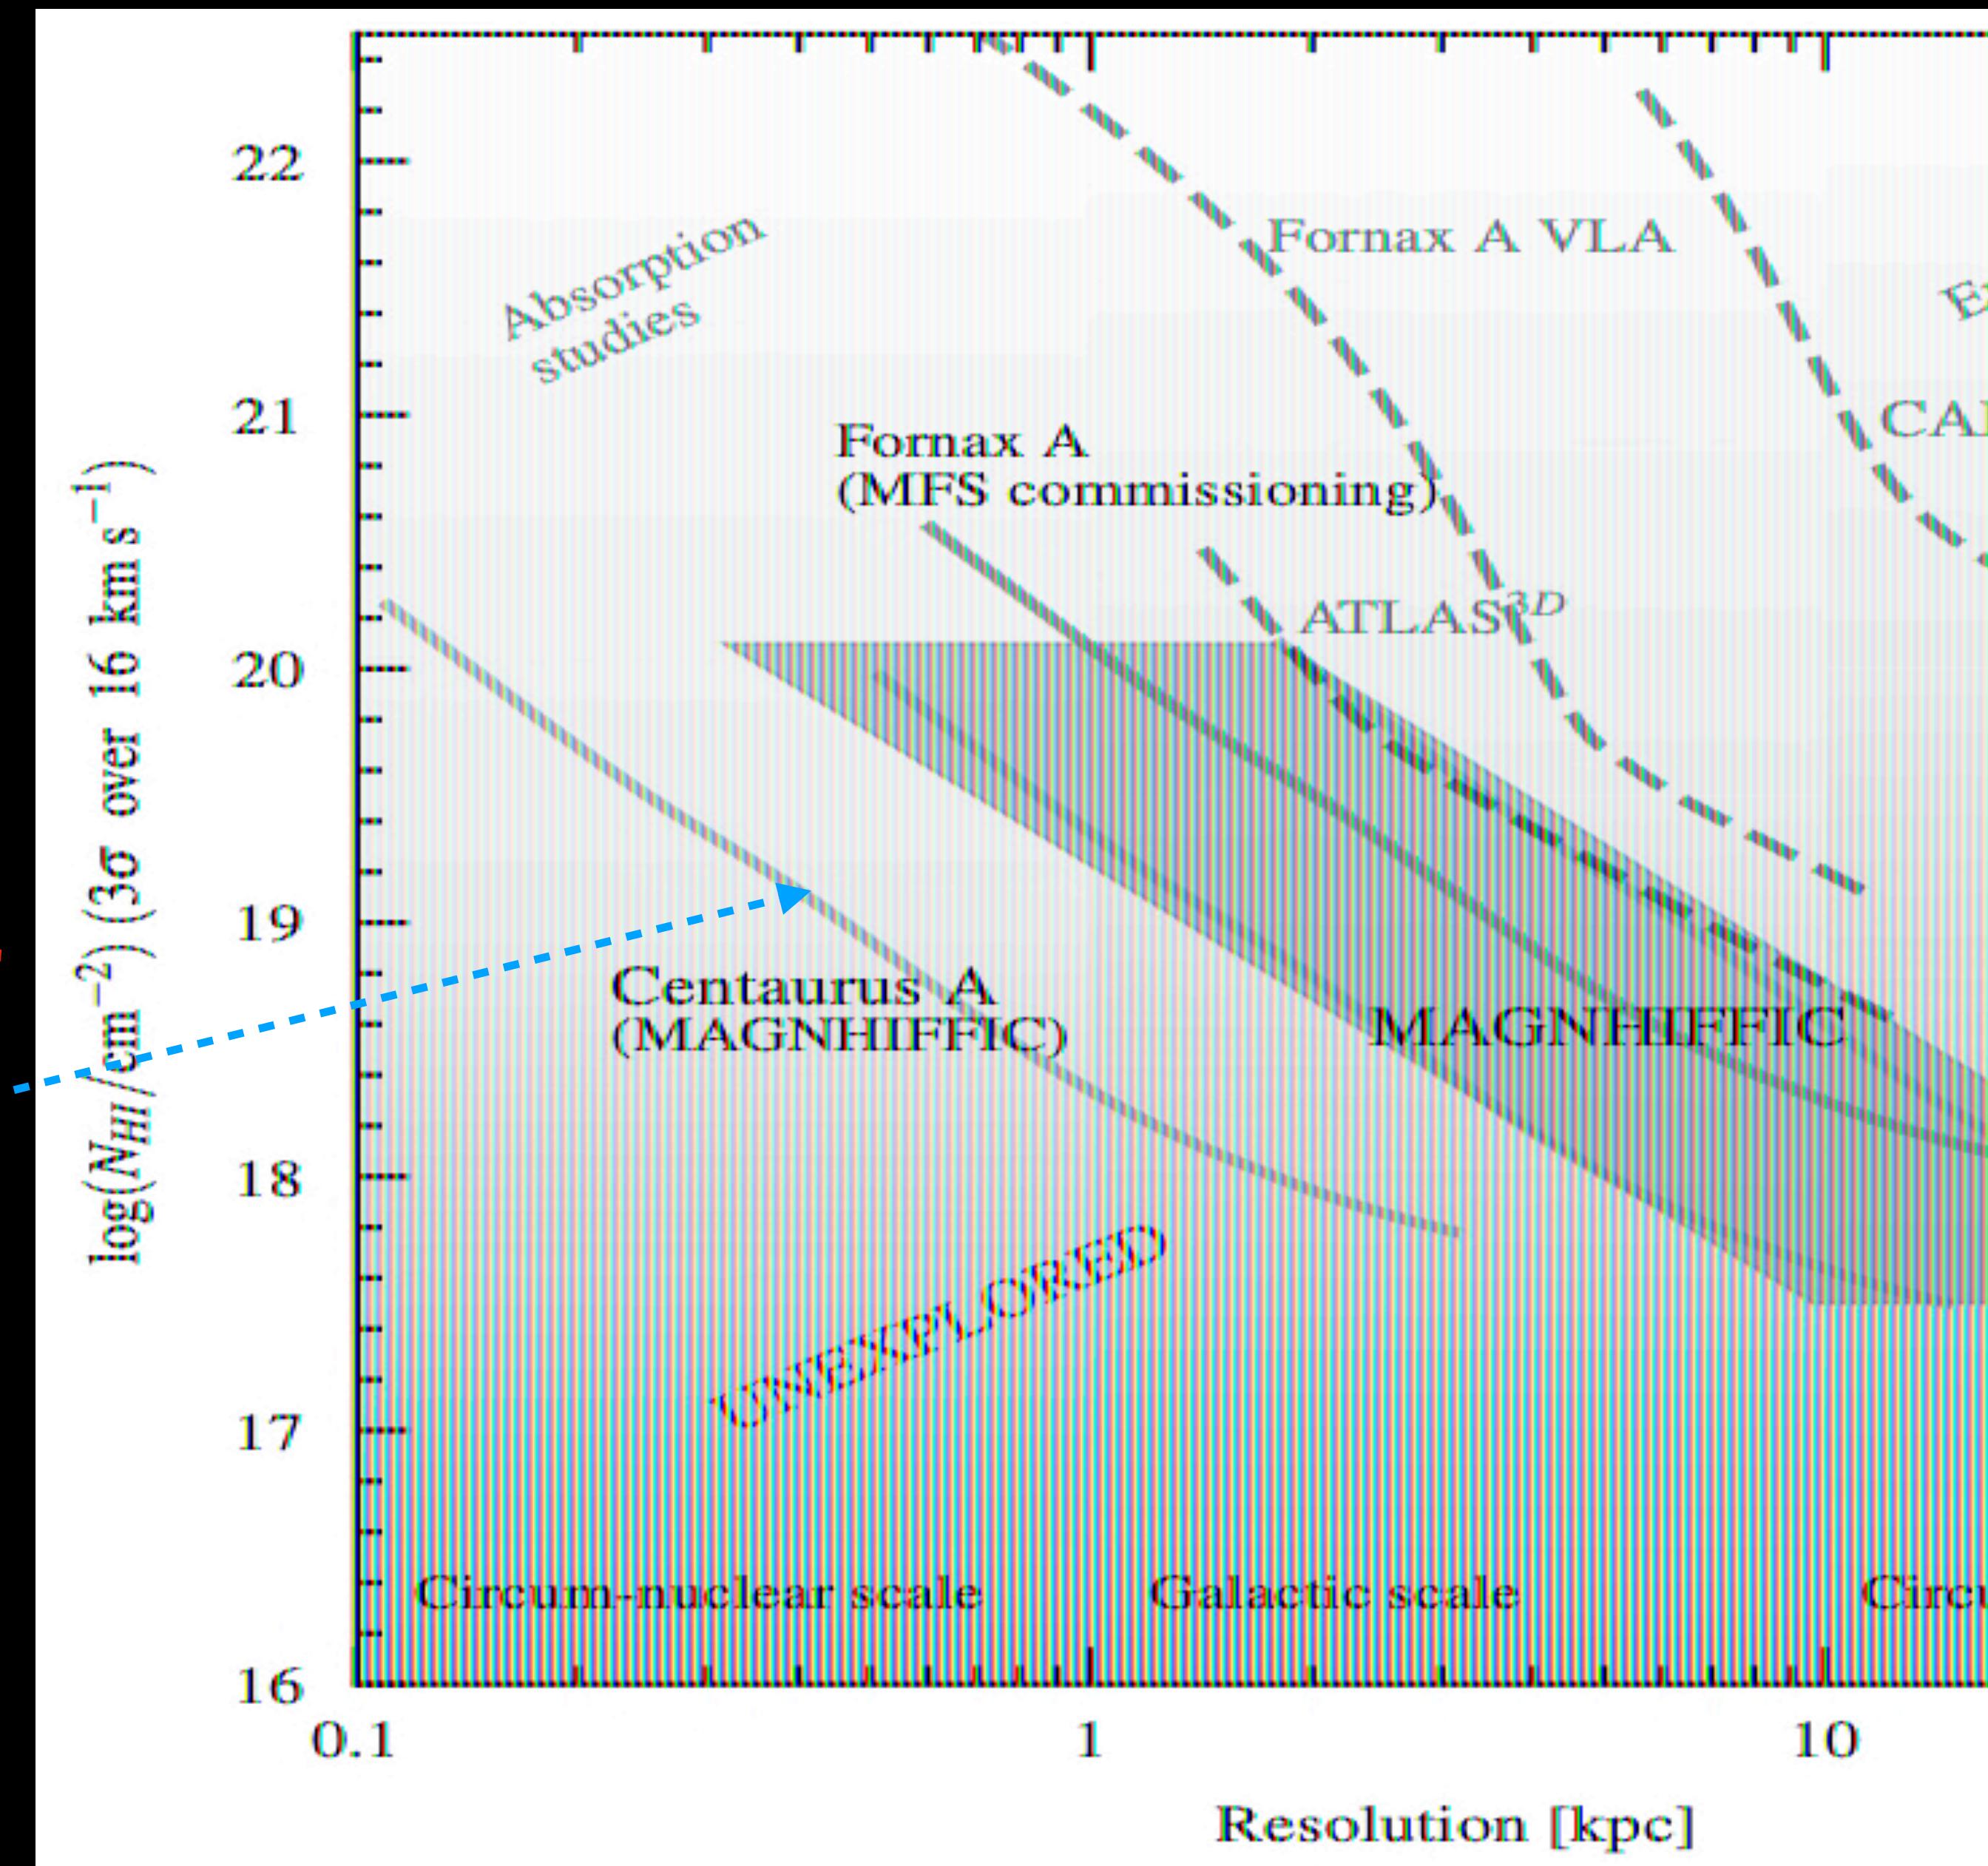

- MeerKAT has constant noise over all scales
- MHONGOOSE detects low column density HI with single dish survey sensitivity, over all scales

courtesy of E. de Blok

MAGNHIFFIC - sensitivity and resolution

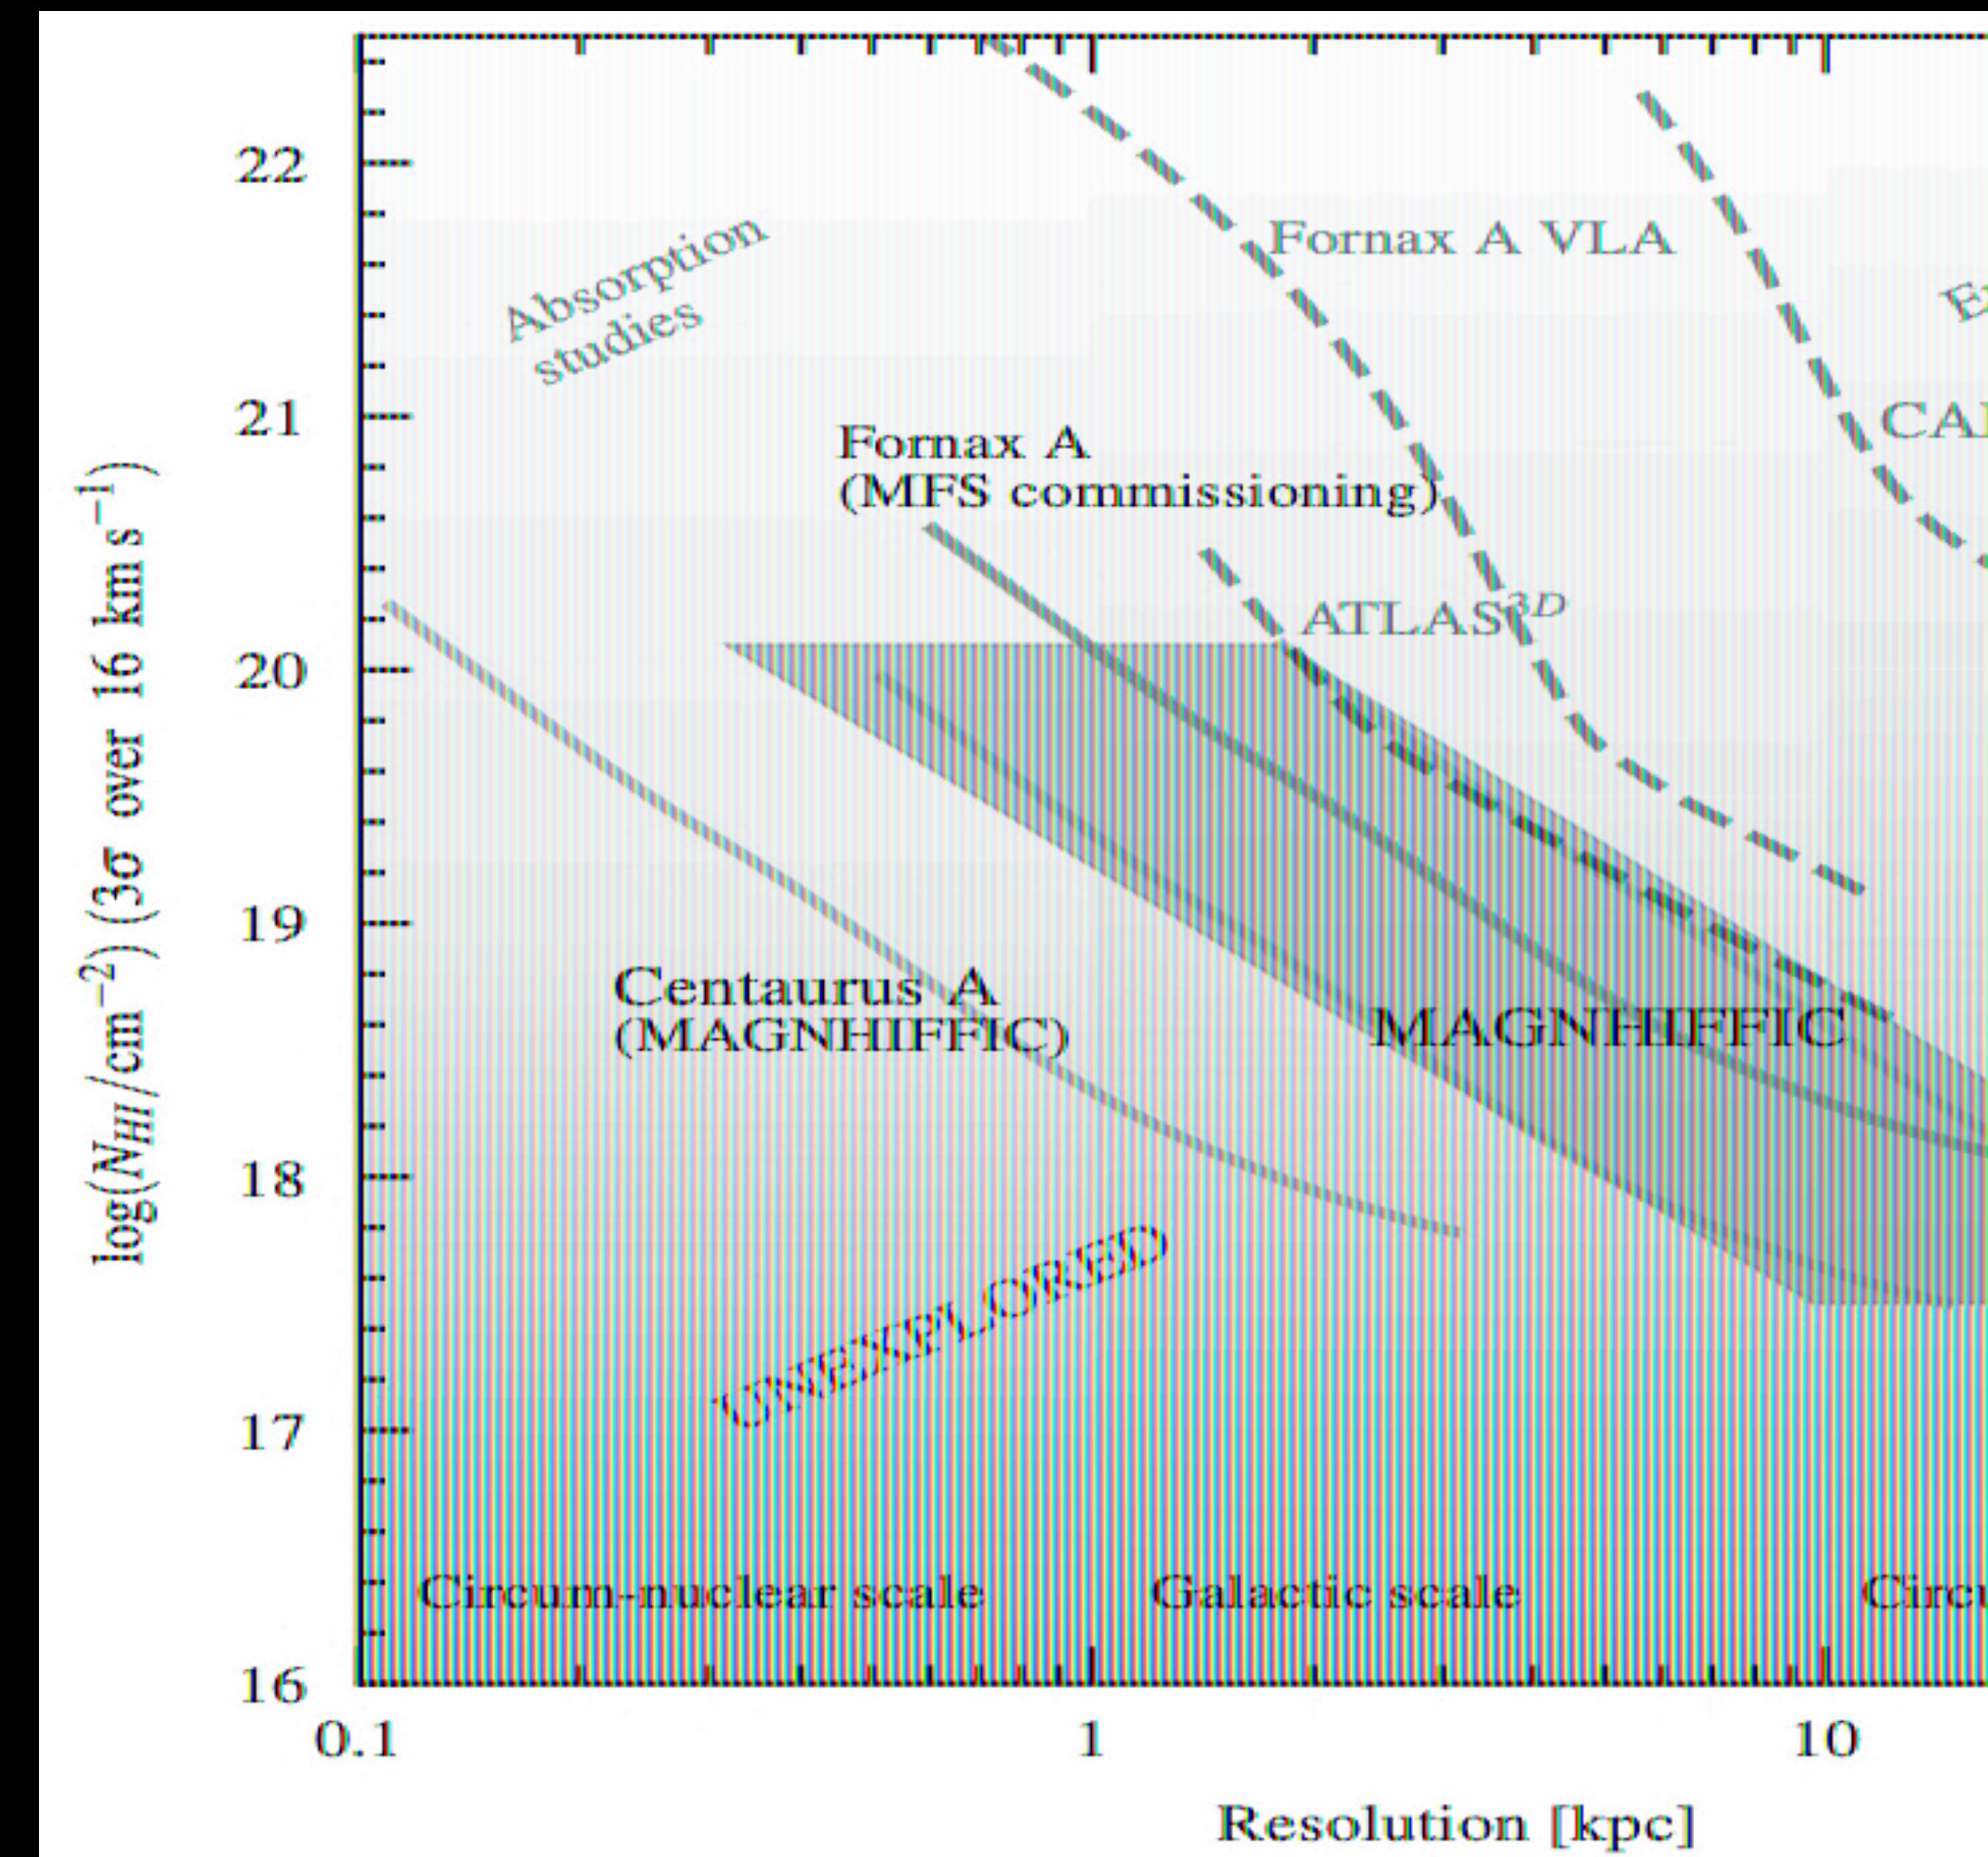

- MeerKAT observations of nearby AGN ($\lesssim 130$ Mpc)
- **Investigating a new parameter space for AGN feeding & feedback**
- Unexplored column densities on kilo-parsec scales

MAGNHIFFIC - sensitivity and resolution

MAGNHIFFIC

- How does gas regulate the recursive nuclear activities of galaxies?
- Wide field deep HI observations of **22 nearby AGN ($D_L < 130 \text{ Mpc}$)**
- Study the low column density neutral hydrogen: $\text{N(HI)} \sim 10^{18-20} \text{ cm}^{-2}$
- Connect the life cycle of AGN with the physical conditions of the ISM and IGM
- Understand the impact of multi-phase AGN feeding and feedback from the circum-nuclear to the circum-galactic scale

MAGNHIFIC - the sample

MeerKAT AGN HI Feeding & Feedback Investigation Close-by

22 nearby AGN (<130 Mpc) with different energetic outputs, ages, hosts and environments

3 σ N(HI) at $30'' < 5 \times 10^{18} \text{ cm}^{-2}$

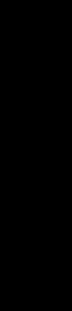

3 σ N(HI) at $8'' < 5 \times 10^{19} \text{ cm}^{-2}$

Radiative AGN/Seyferts

- 4 MHONGOOSE
- 3 Fornax Cluster [MFS]
- 3 Open-time 2022 [PI Maccagni]

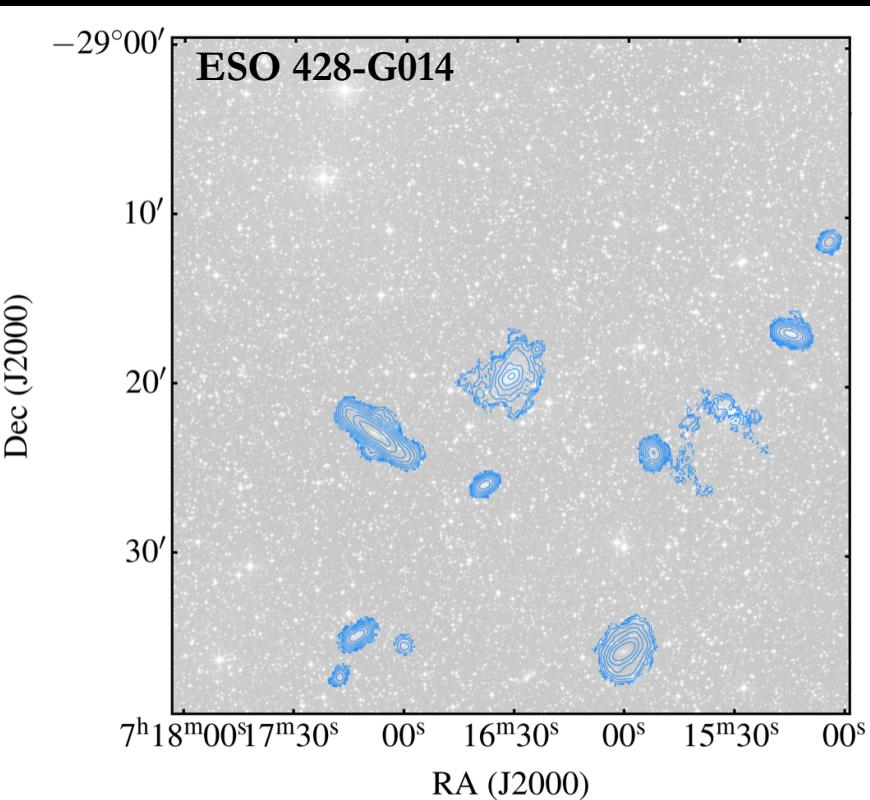

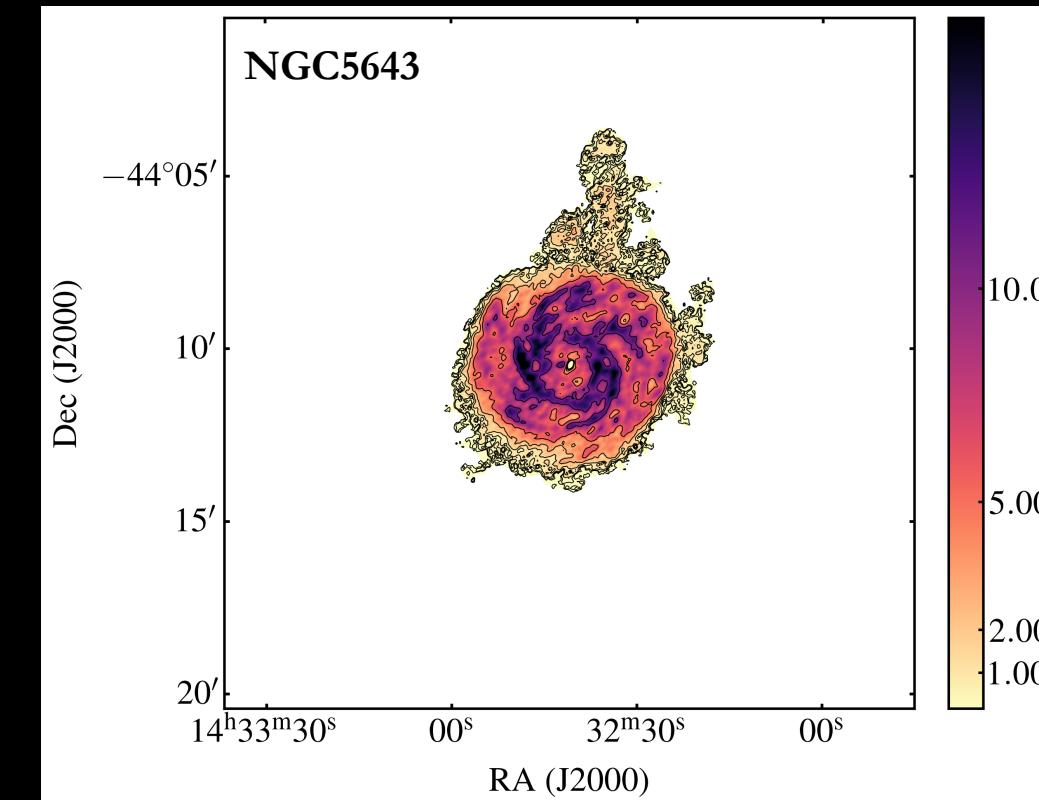

Jetted AGN

- Complete sample of radio loud AGN observed in CO 9 sources [Ruffa et al. 2020] (Open-time, Maccagni & Prandoni)
- NGC1399 (BCG Fornax)
- **Fornax A** [Maccagni et al. 2020,2021]
- **Centaurus A** [Maccagni & McKinley, in prep.]

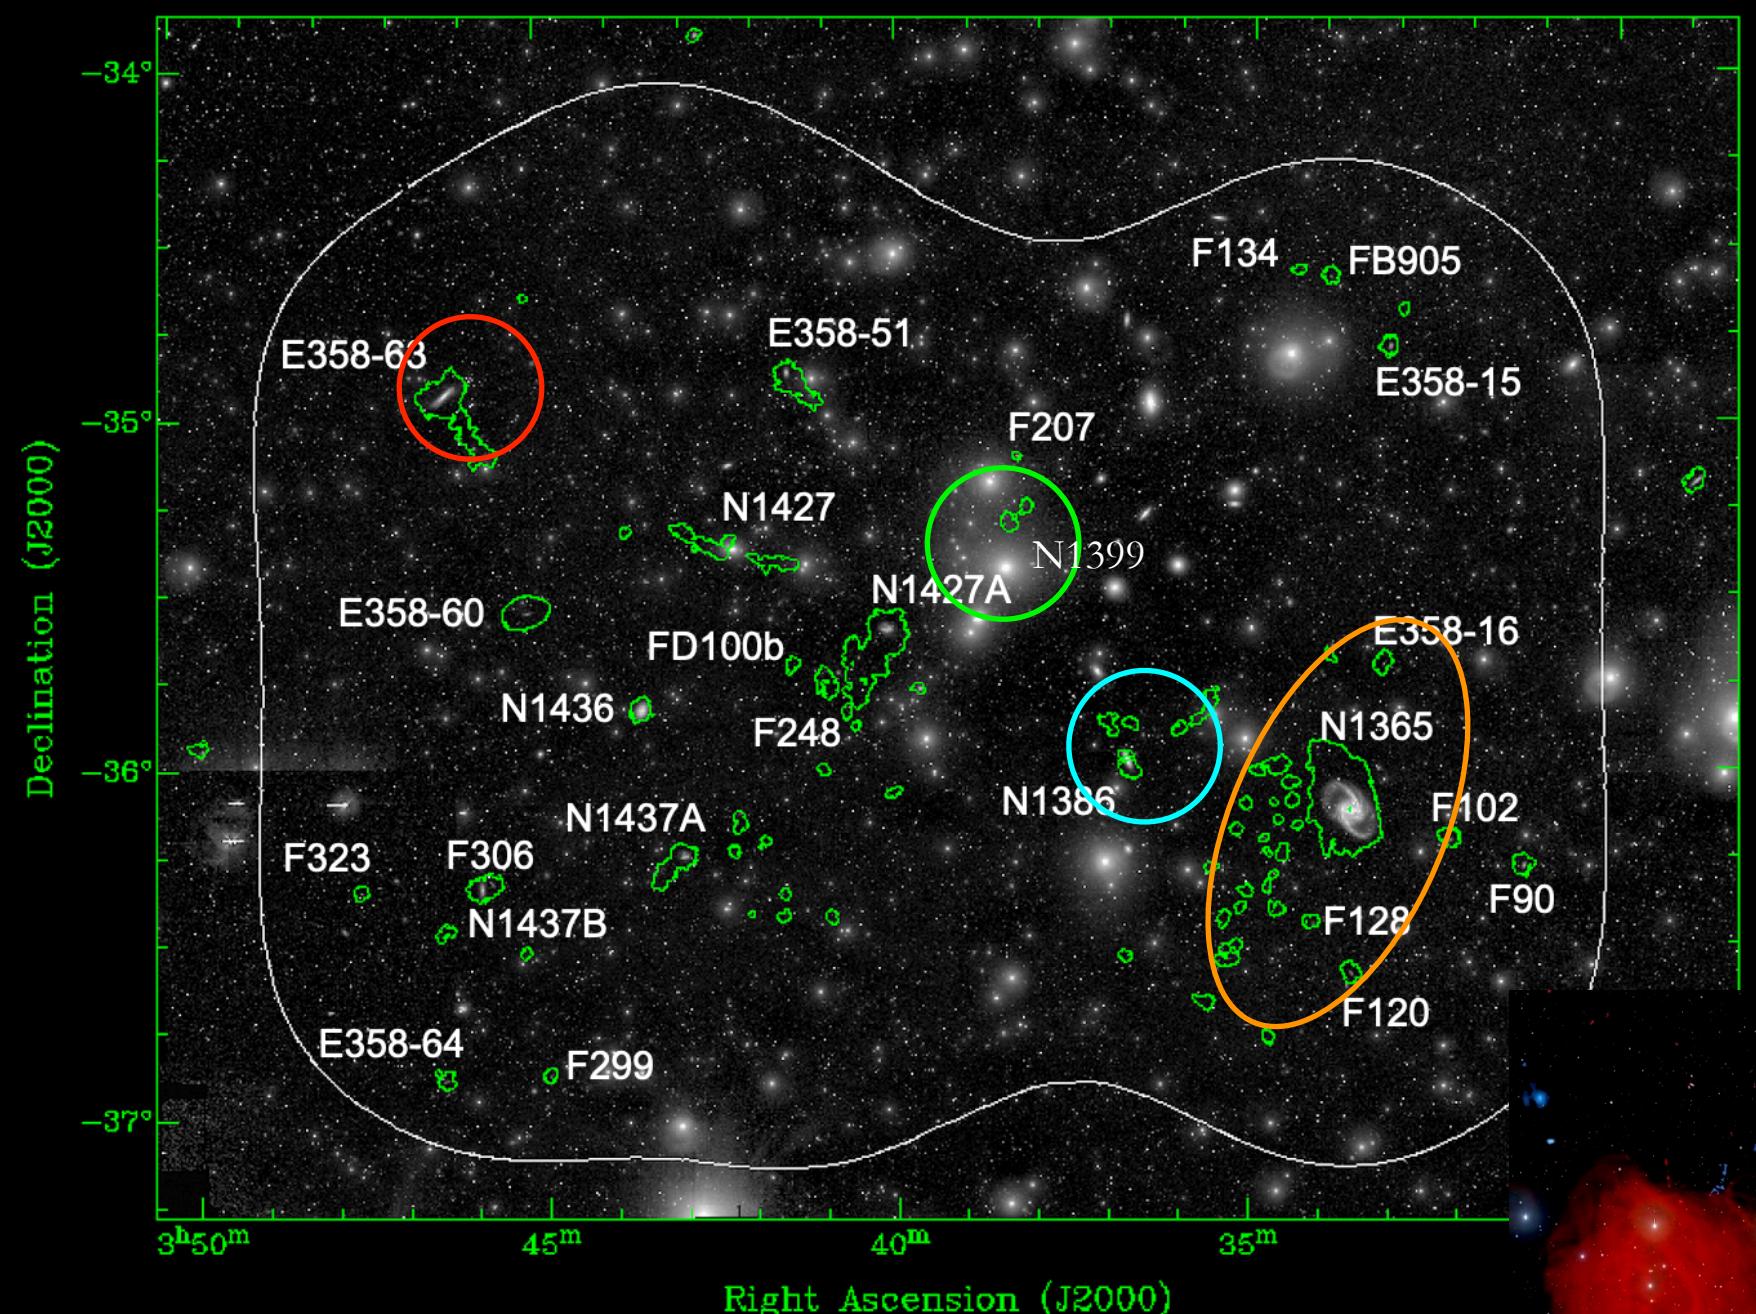

Next Generation MeerKAT LSP? : all (50?) nearby (<100 Mpc) AGN, 32k narrow band, **25 hours per source?**

Nearby Seyfert galaxies

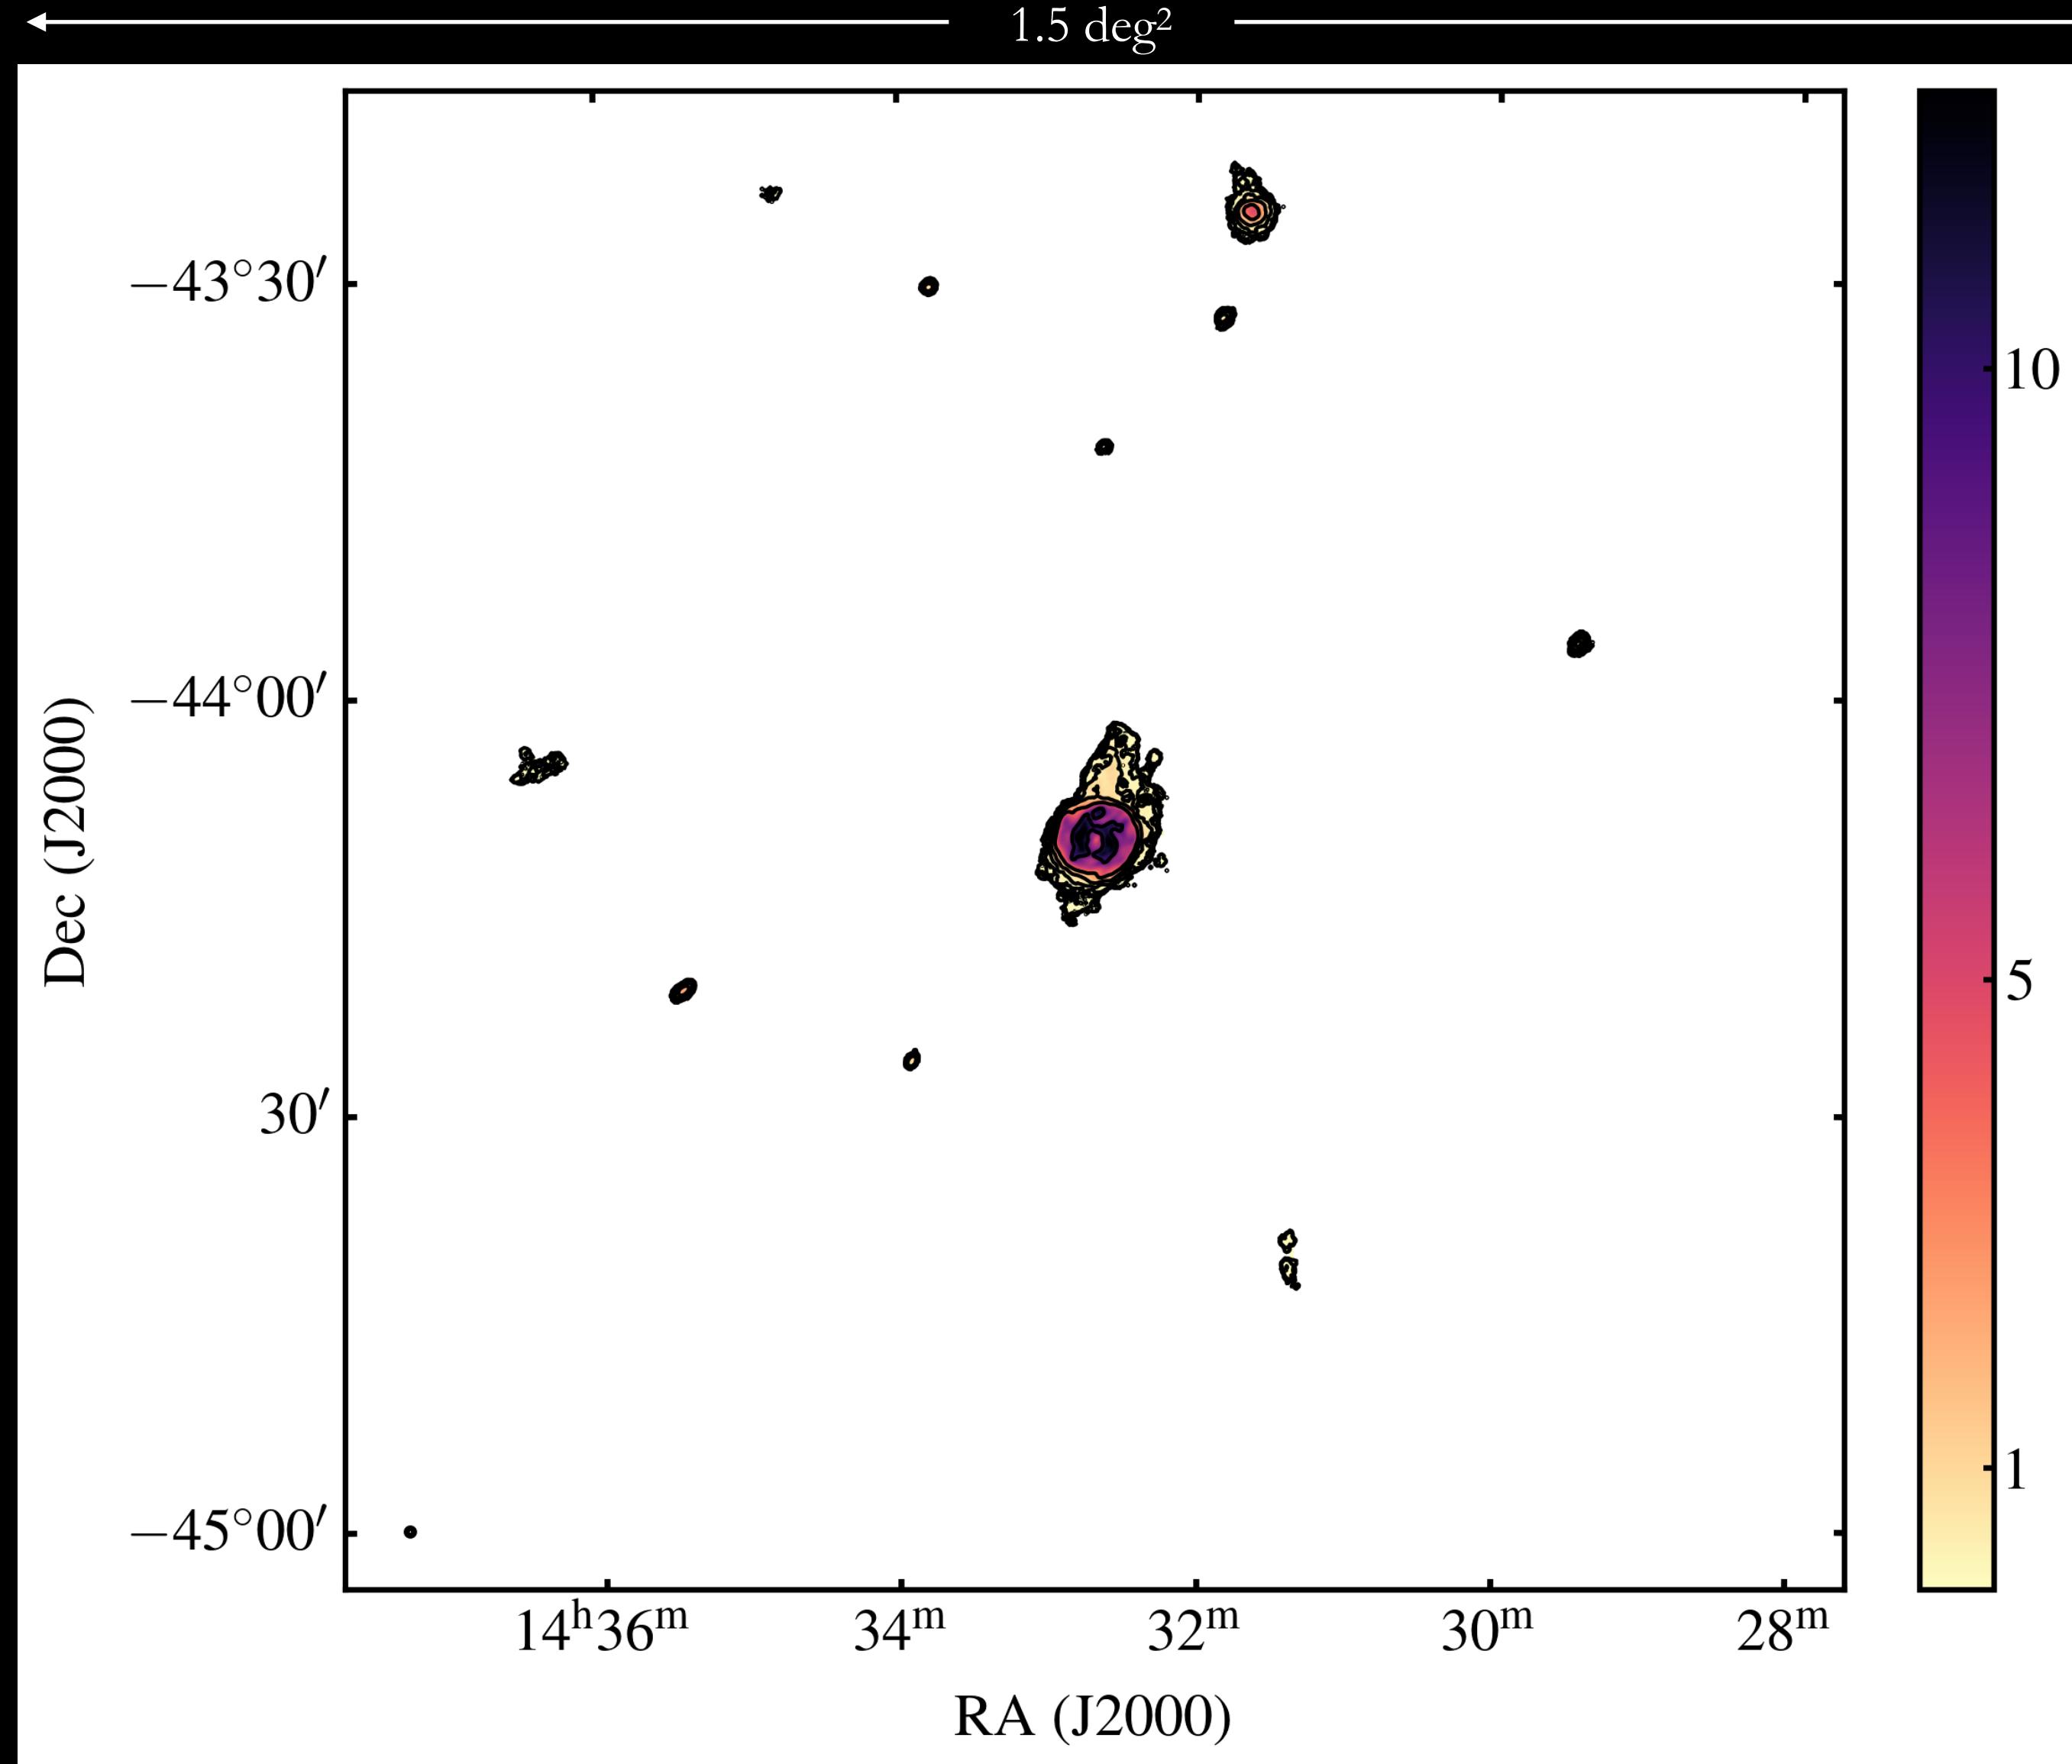

AGN in the Fornax Cluster and Group [MeerKAT Fornax Survey]

Fornax A

MAGNHIFIC - NGC5643

NGC5643 ($D_L = 20.7$ Mpc) shows an AGN driven outflow in the core [X-ray, MUSE & ALMA observations]

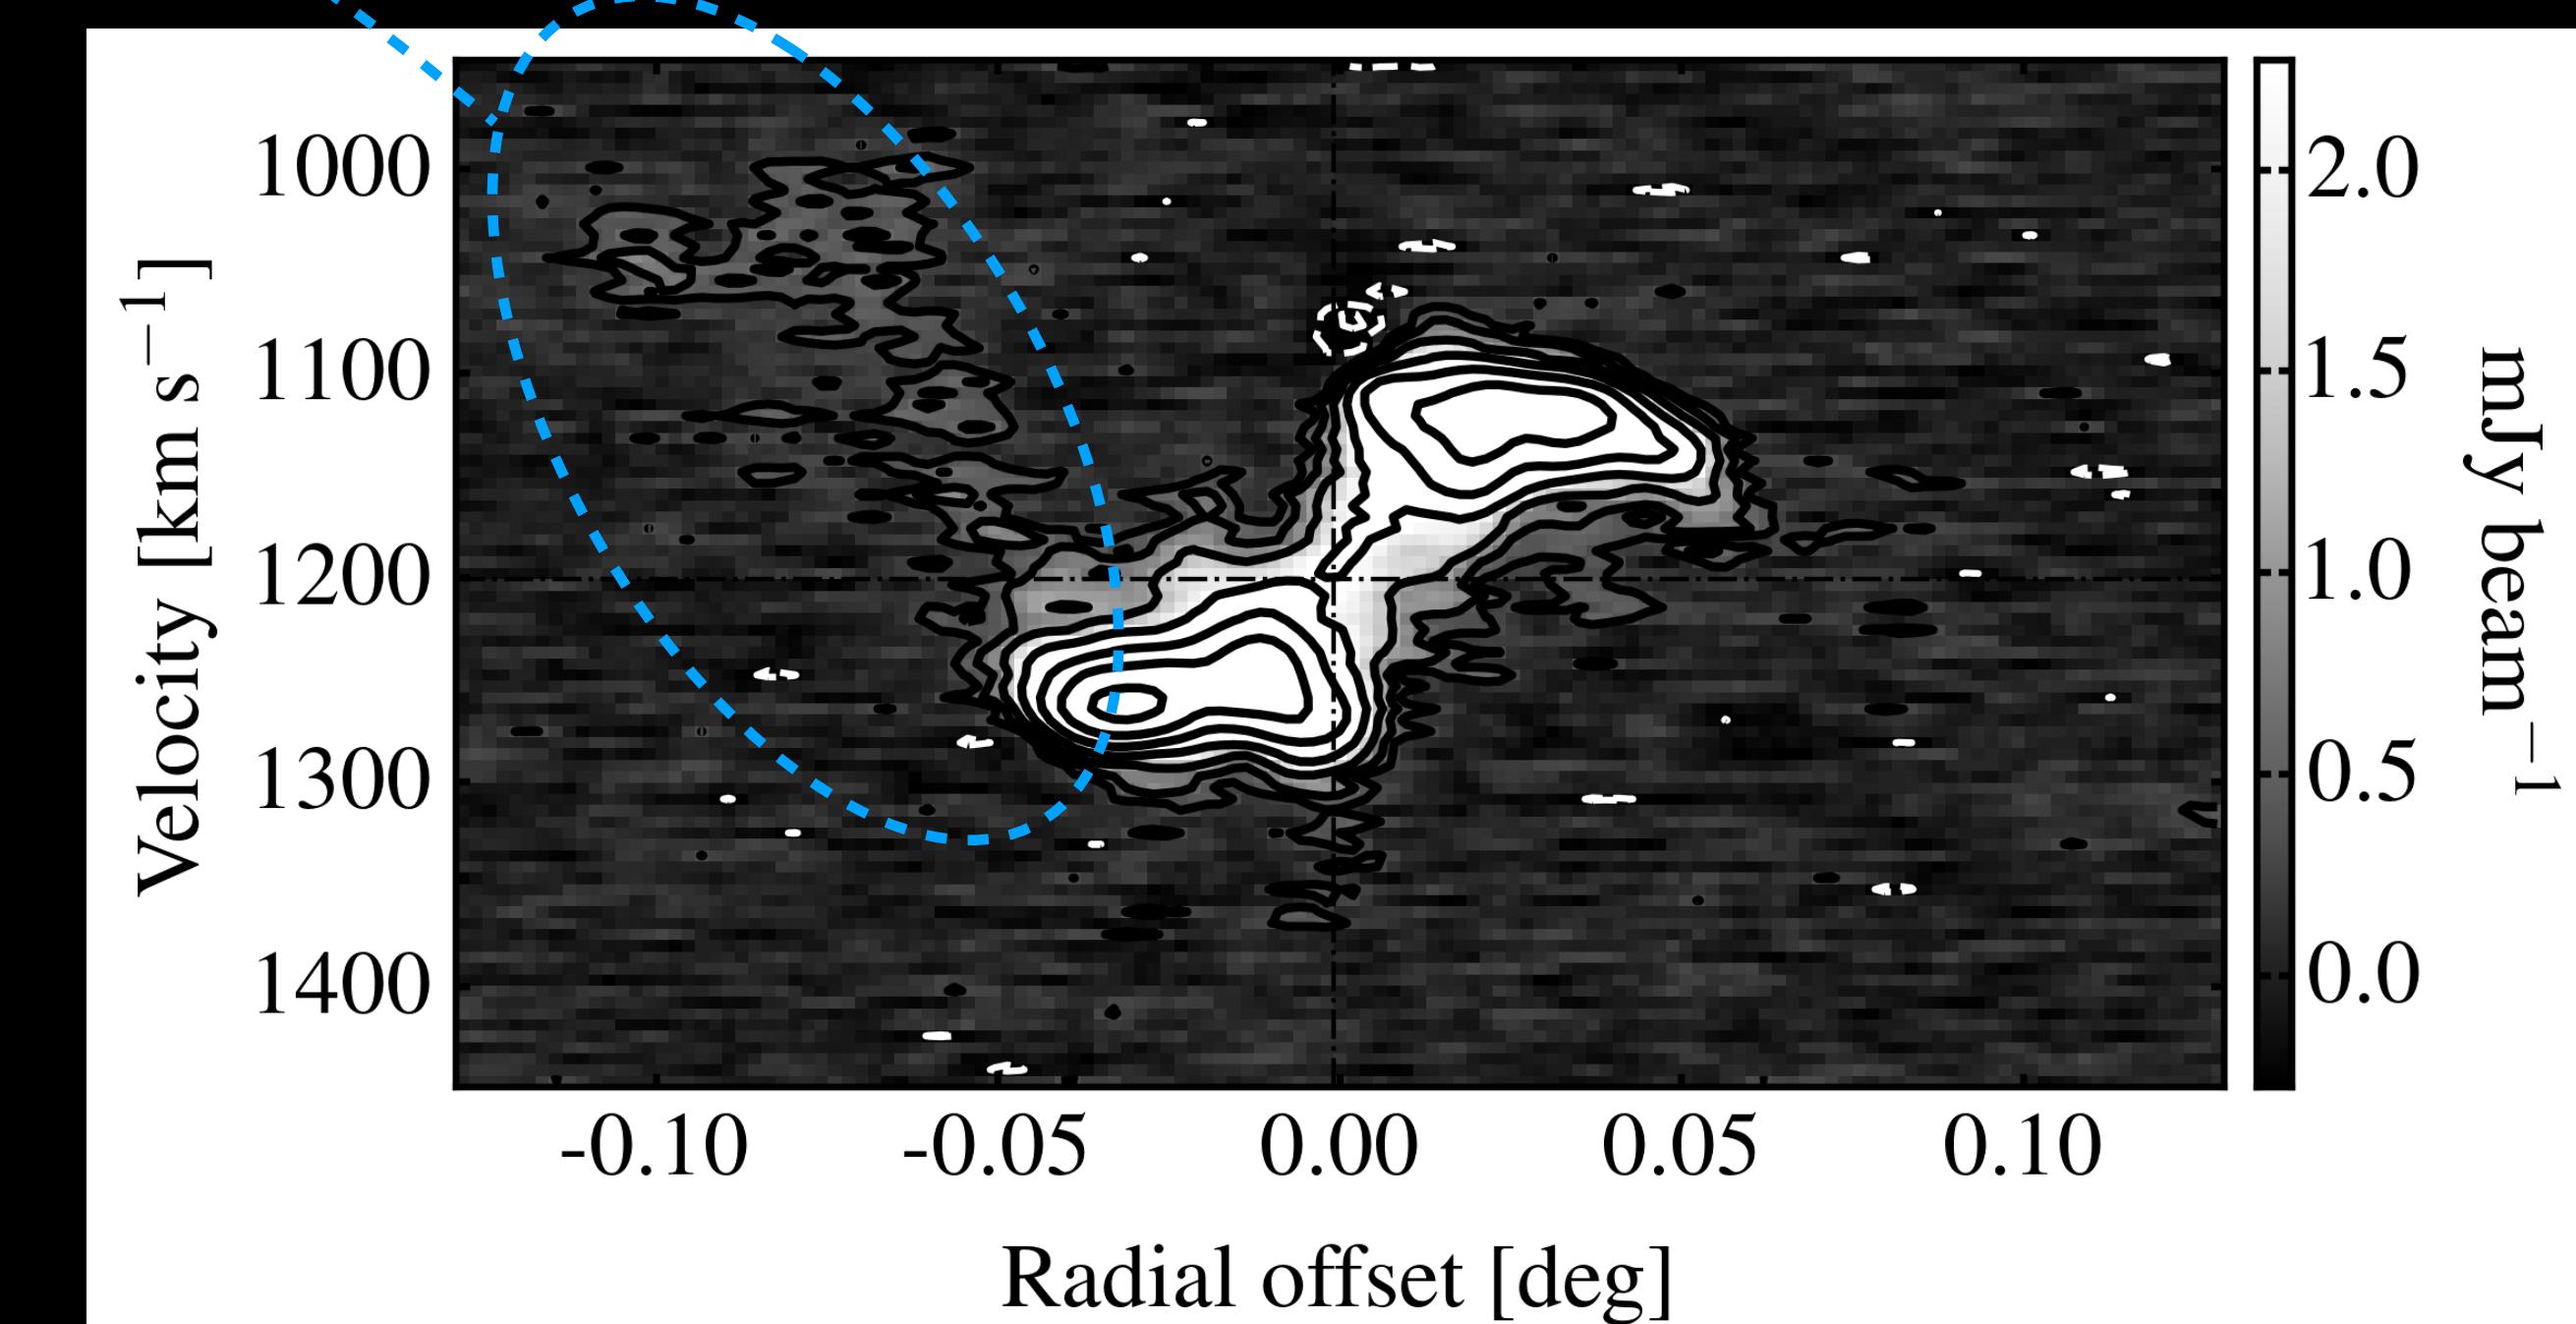

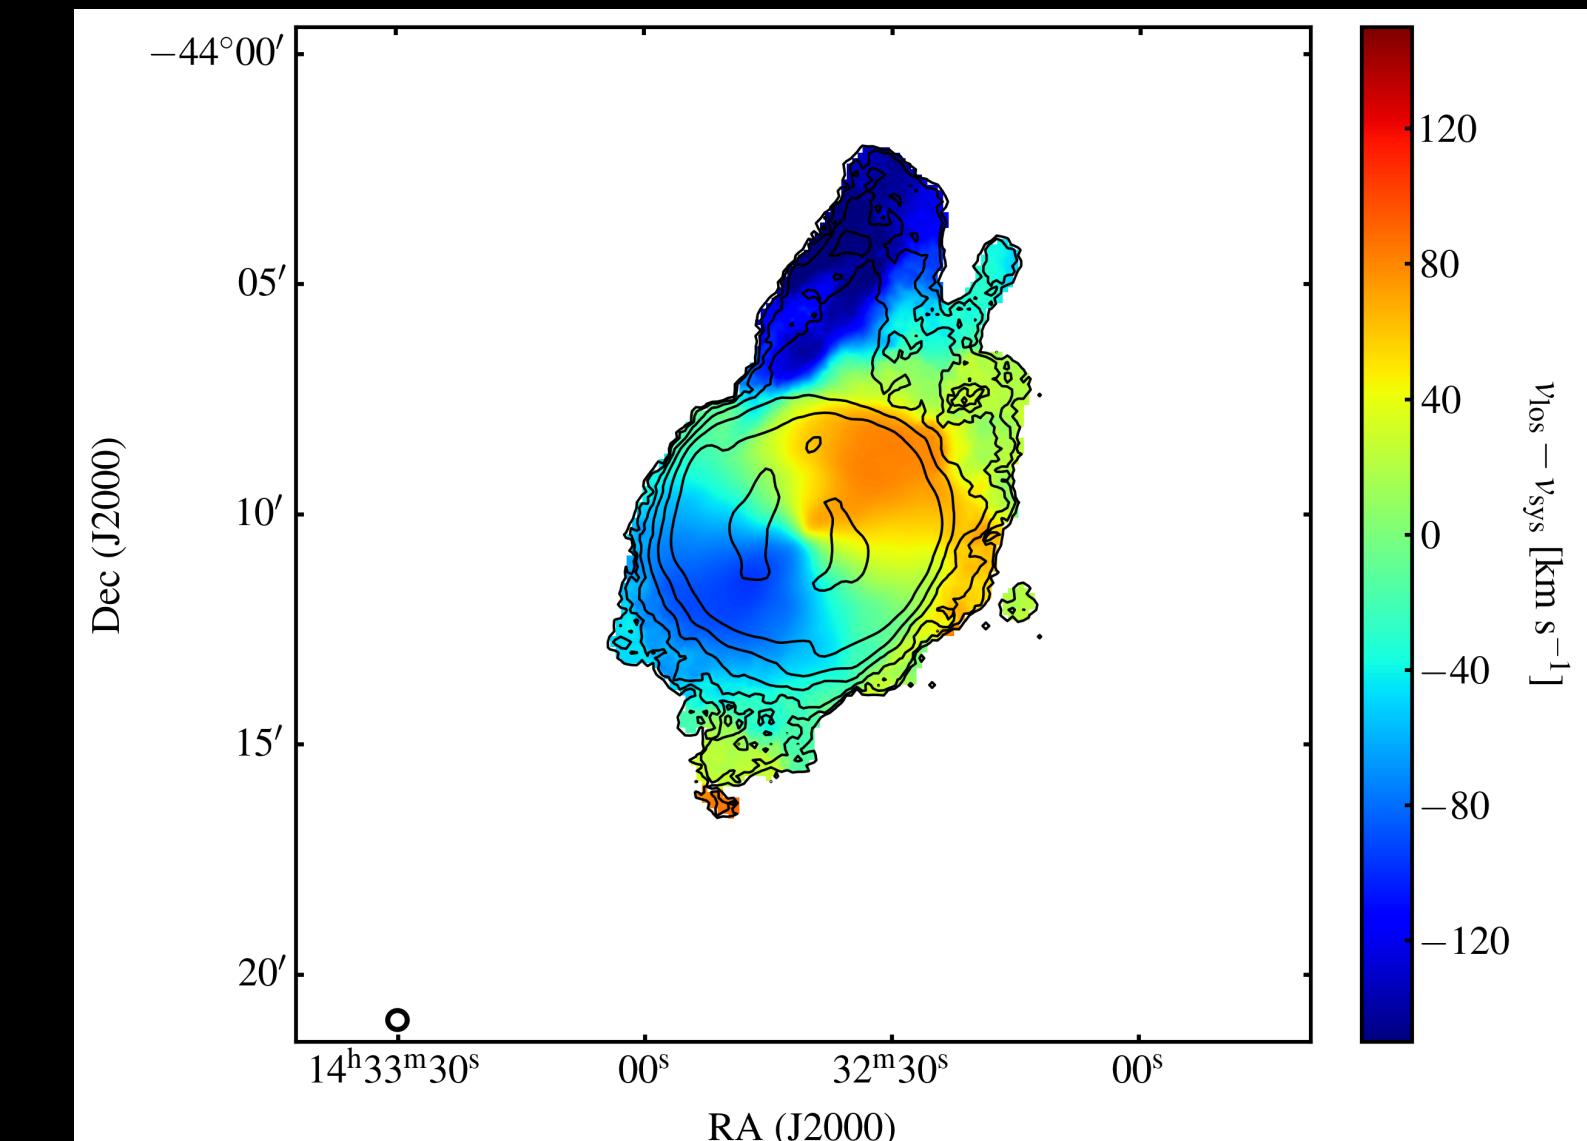

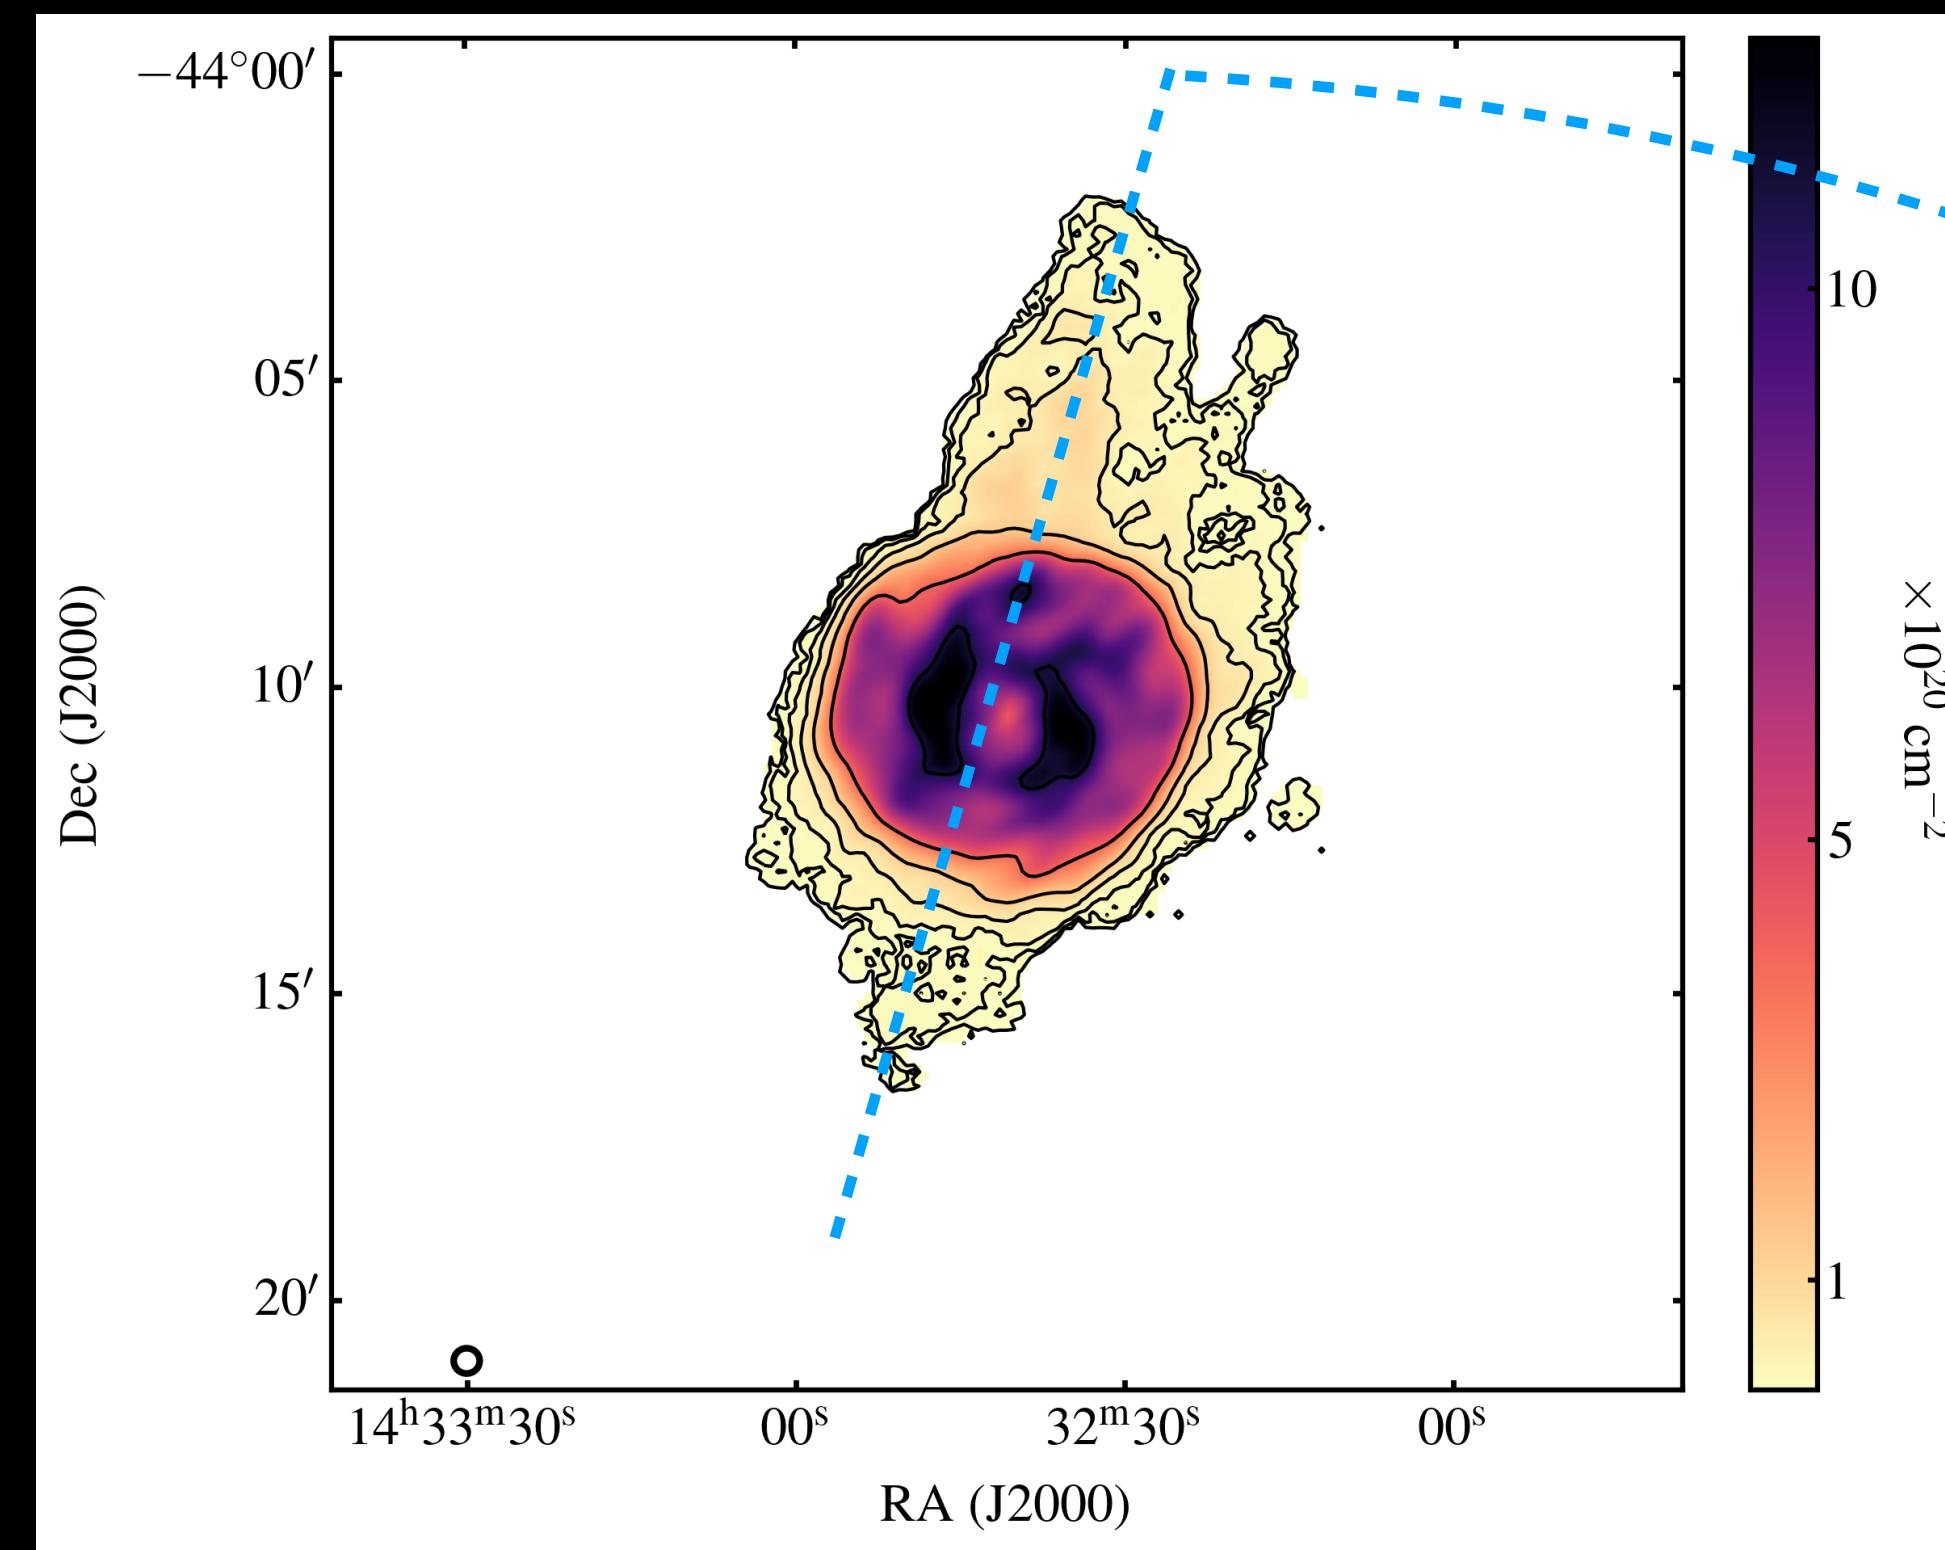

With multi-resolution datacubes MeerKAT (as often) reveals **NGC5643 is in a group with several low mass satellites ($5 \times 10^6 M_\odot$) within ± 700 km s⁻¹**, and much more:

- what is the origin of the northern tail?
- is there an HI outflow?

MAGNHIFIC - NGC5643

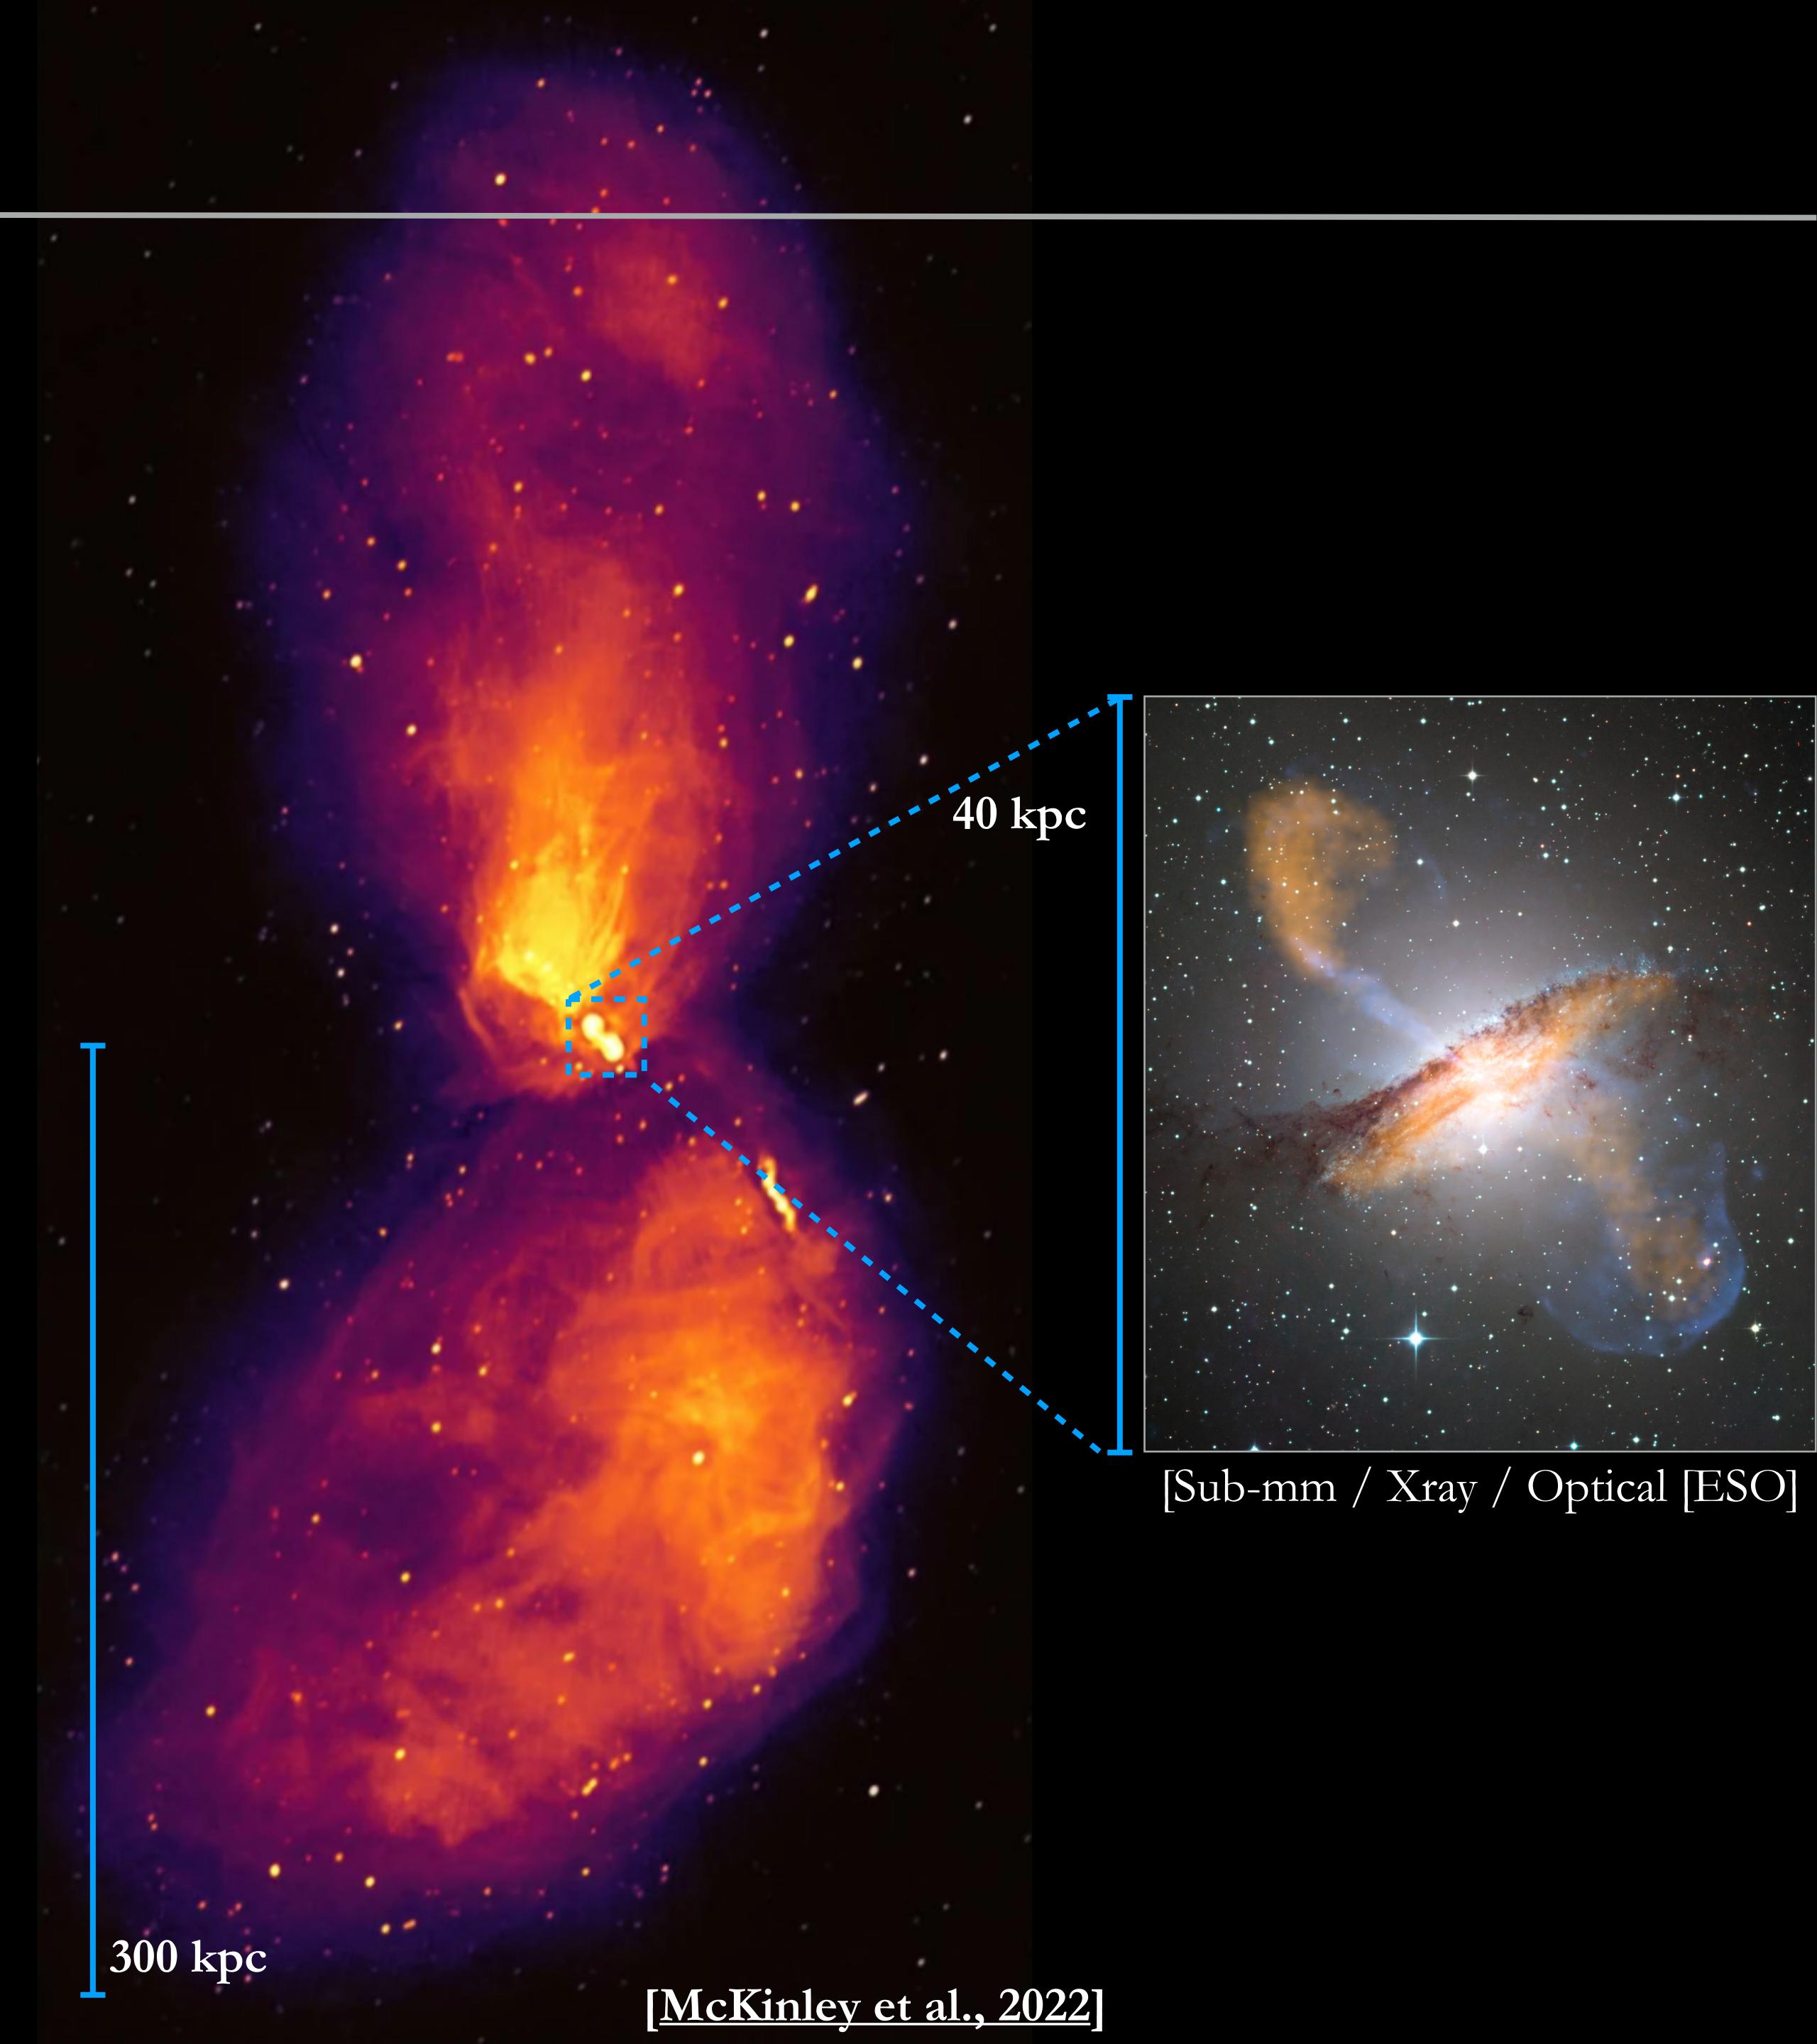

- What is the origin of the northern tail in NGC5643?
- Is gas falling towards the AGN?
- Is NGC5643 undergoing a tidal interaction with a satellite?

-> Answers will be found by Karina Santana @
ASTRON Summer Student program 2023

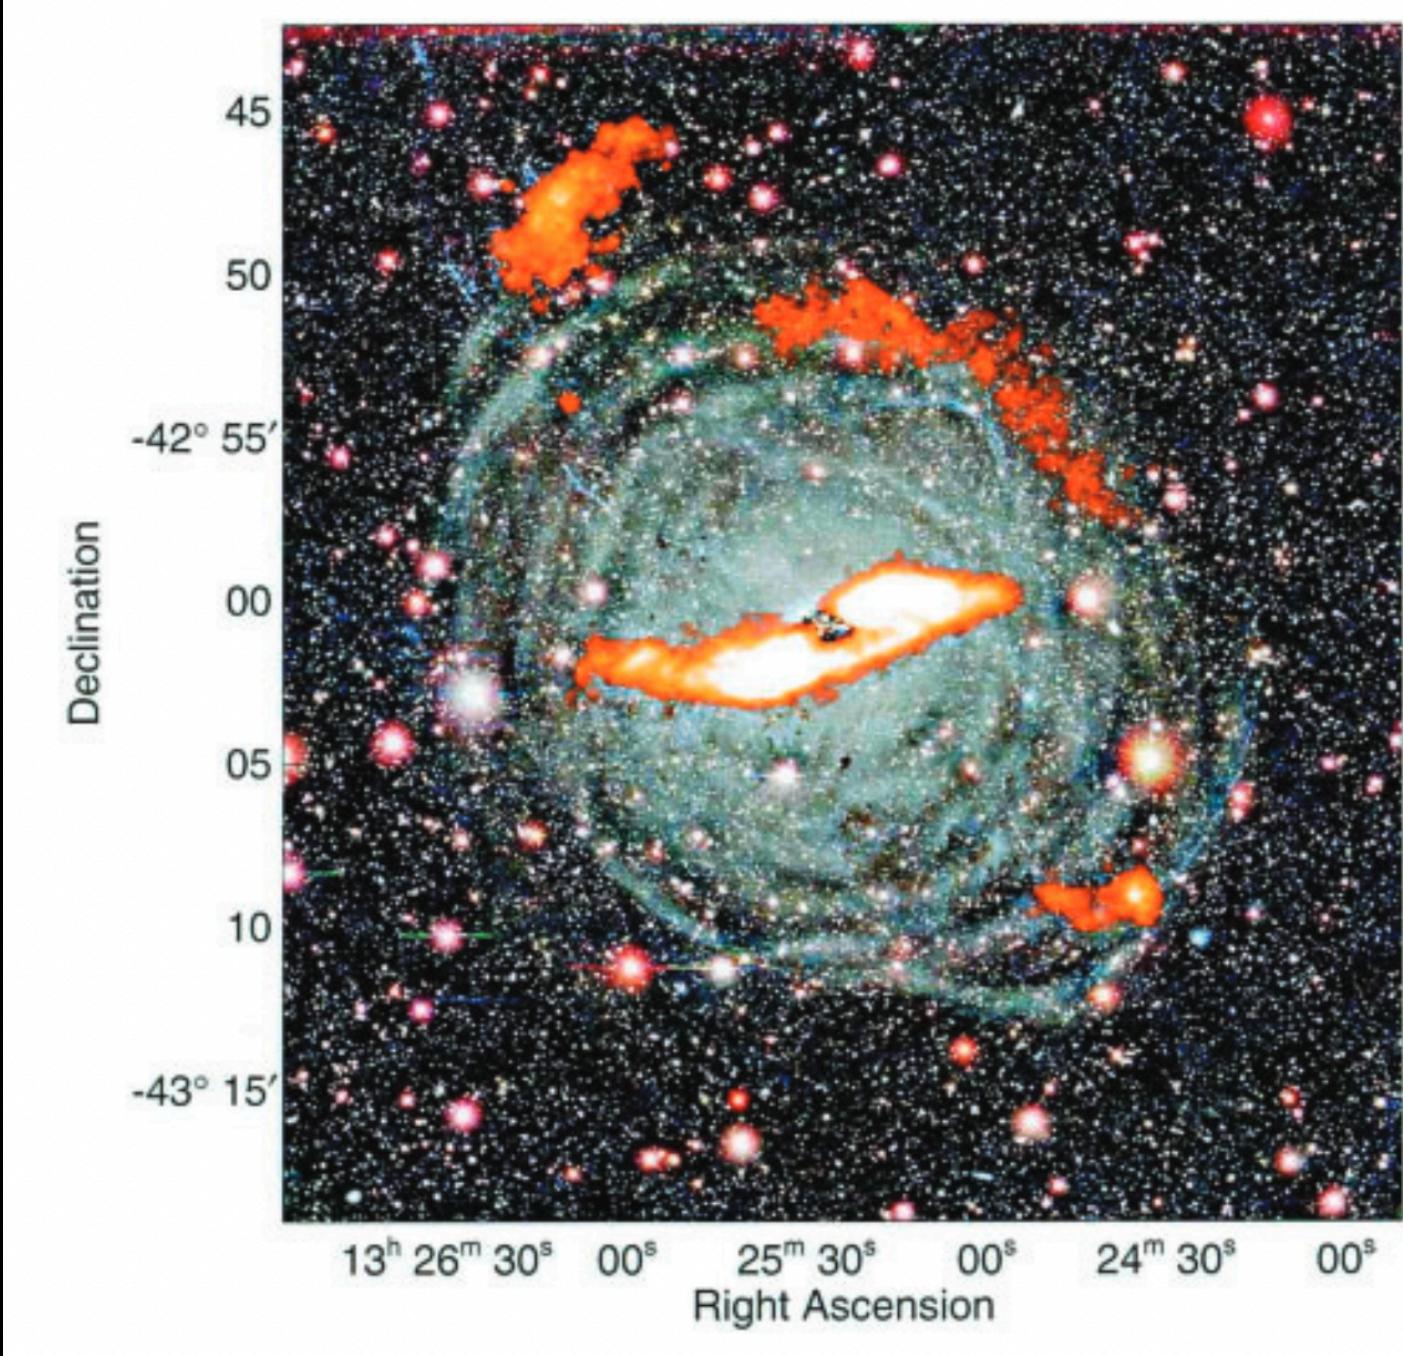

Centaurus A

- AGN structures within the stellar body (< 25 kpc)
 - Jets & filament
 - Lobes
 - Bubbles
 - Circumnuclear dusty disk ($r \sim 6$ kpc)
- Regions of AGN-triggered star formation
 - Outer Filament (20 kpc from centre) e.g. [Santoro et al. 2016](#)
 - Inner Filament (7 kpc from centre) e.g. [Crockett et al. 2015](#)

Centaurus A - Neutral Hydrogen

ATCA [Morganti 2010]

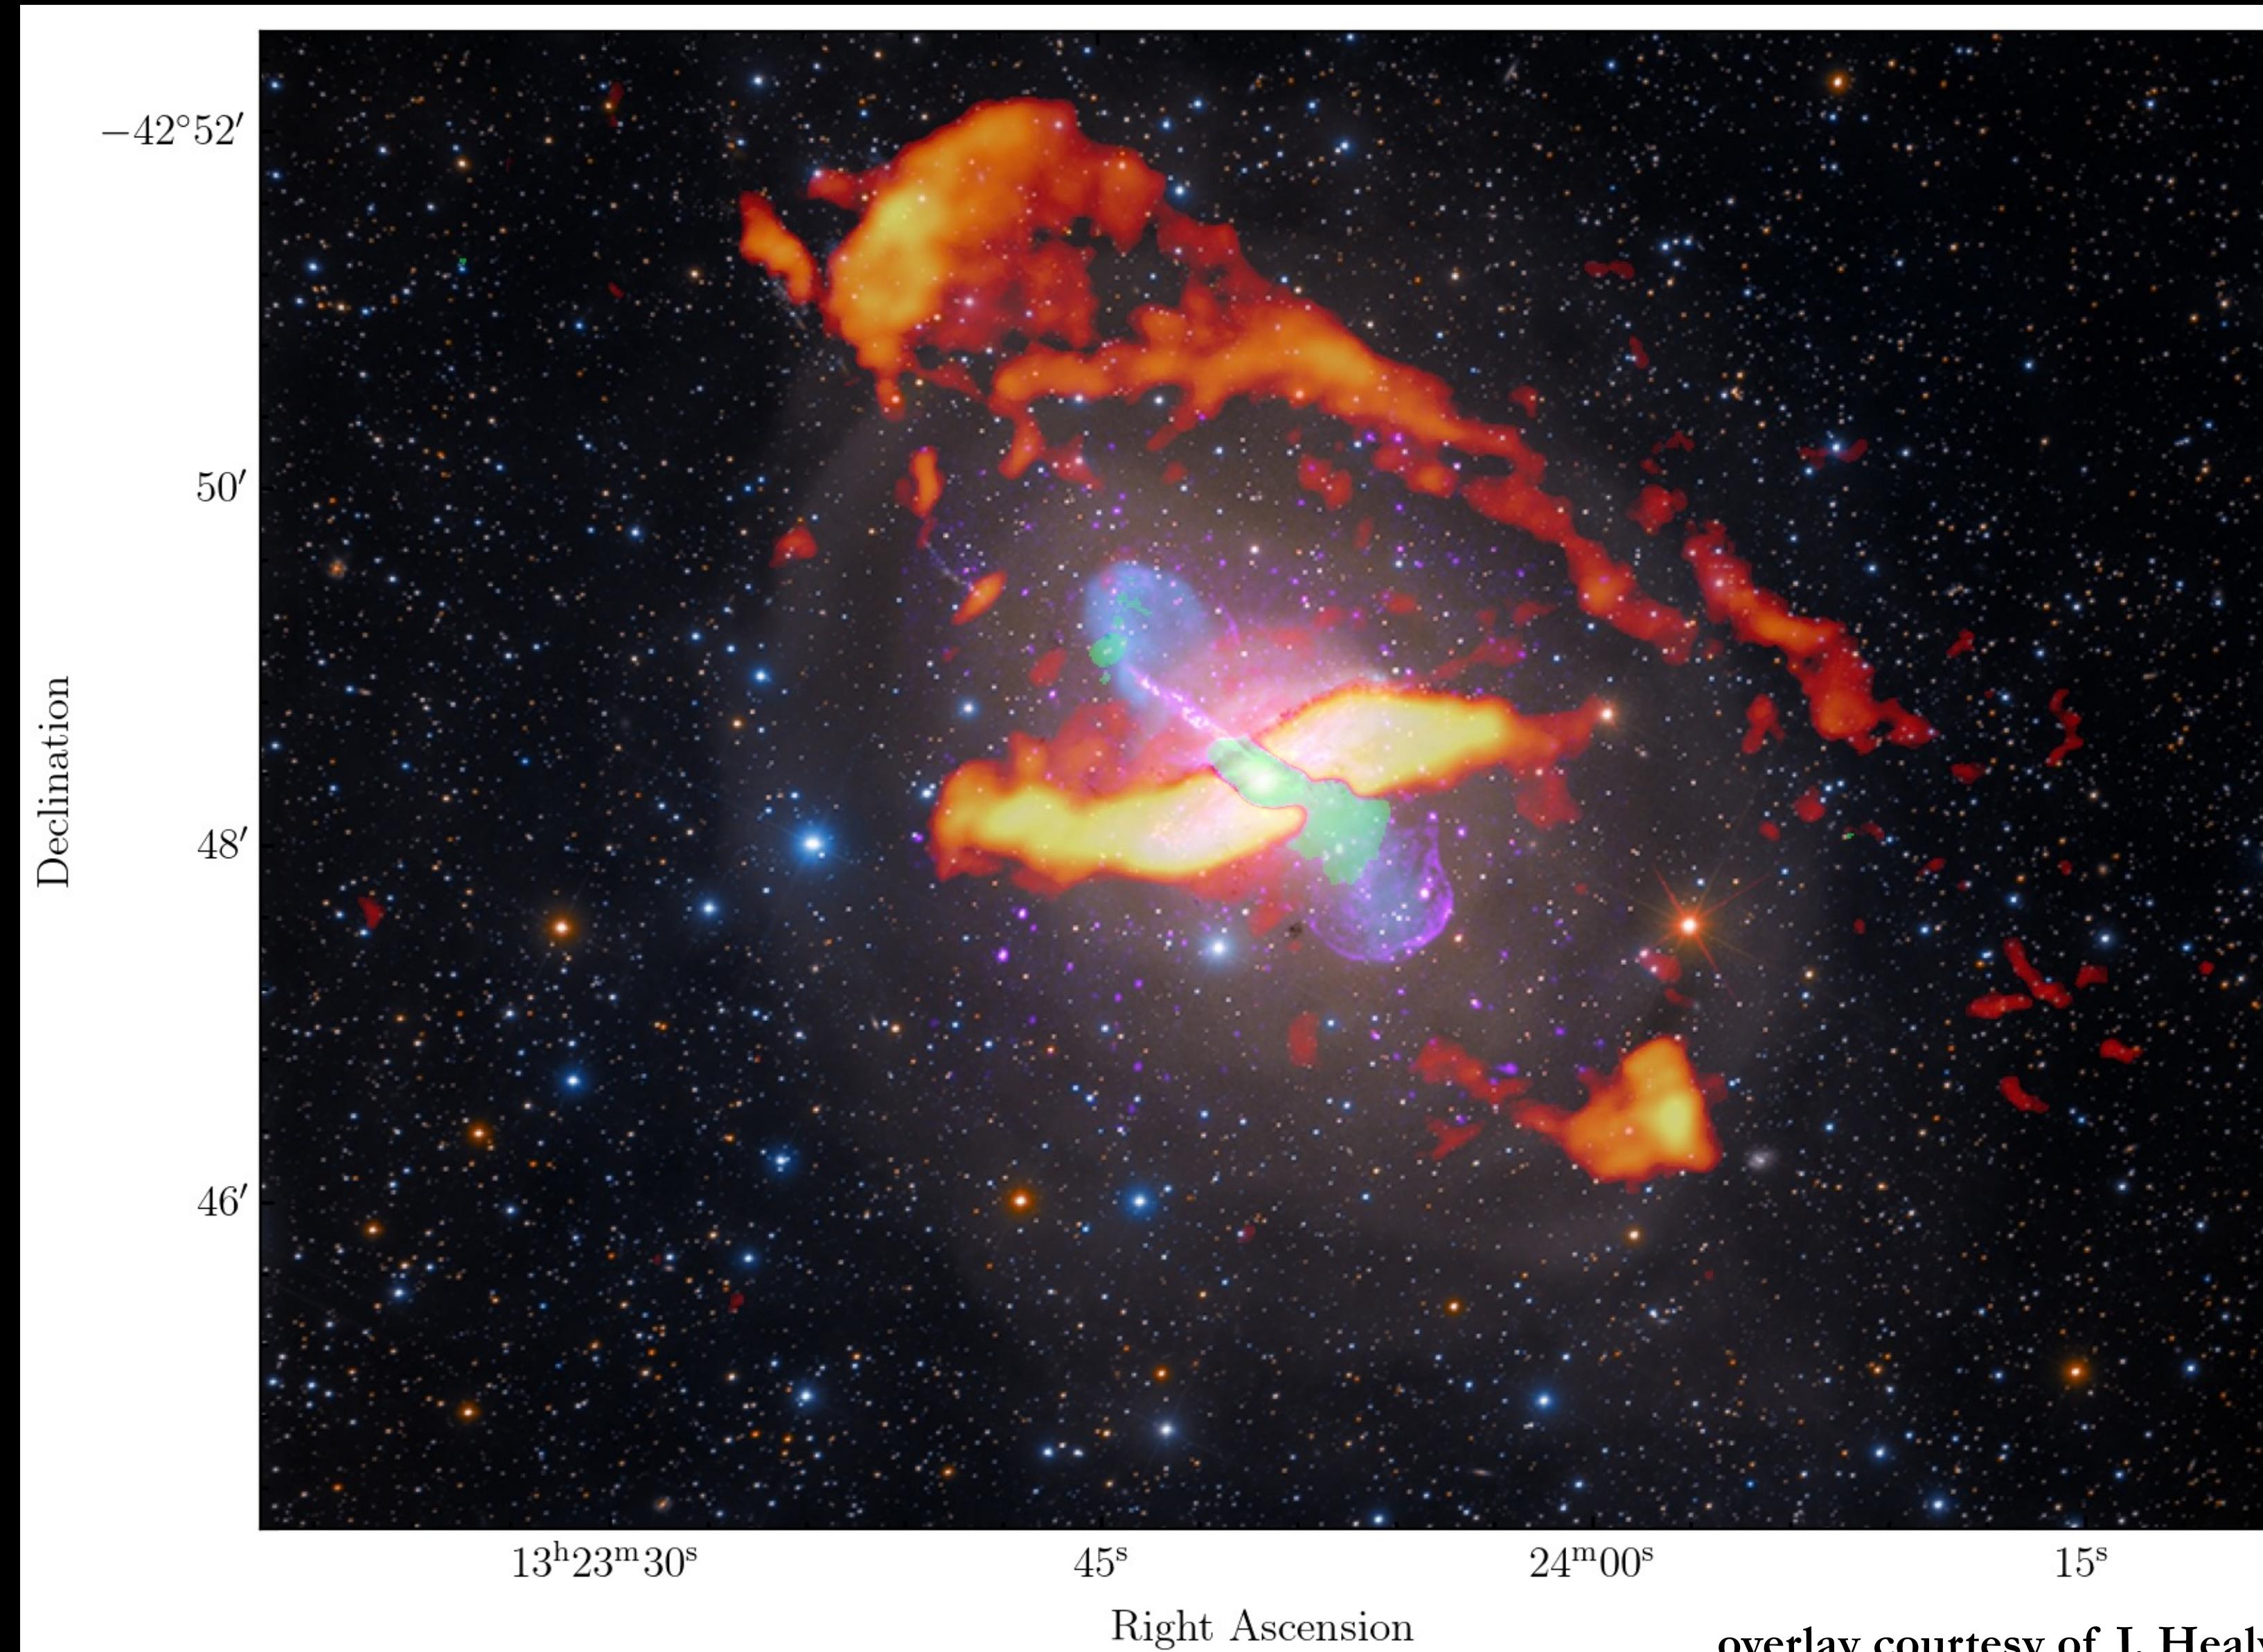

- Radio continuum
- HI emission
- HI absorption

HI clouds along the jets and filaments of ionised gas

Low column density HI $\sim 10^{19}$ cm $^{-2}$

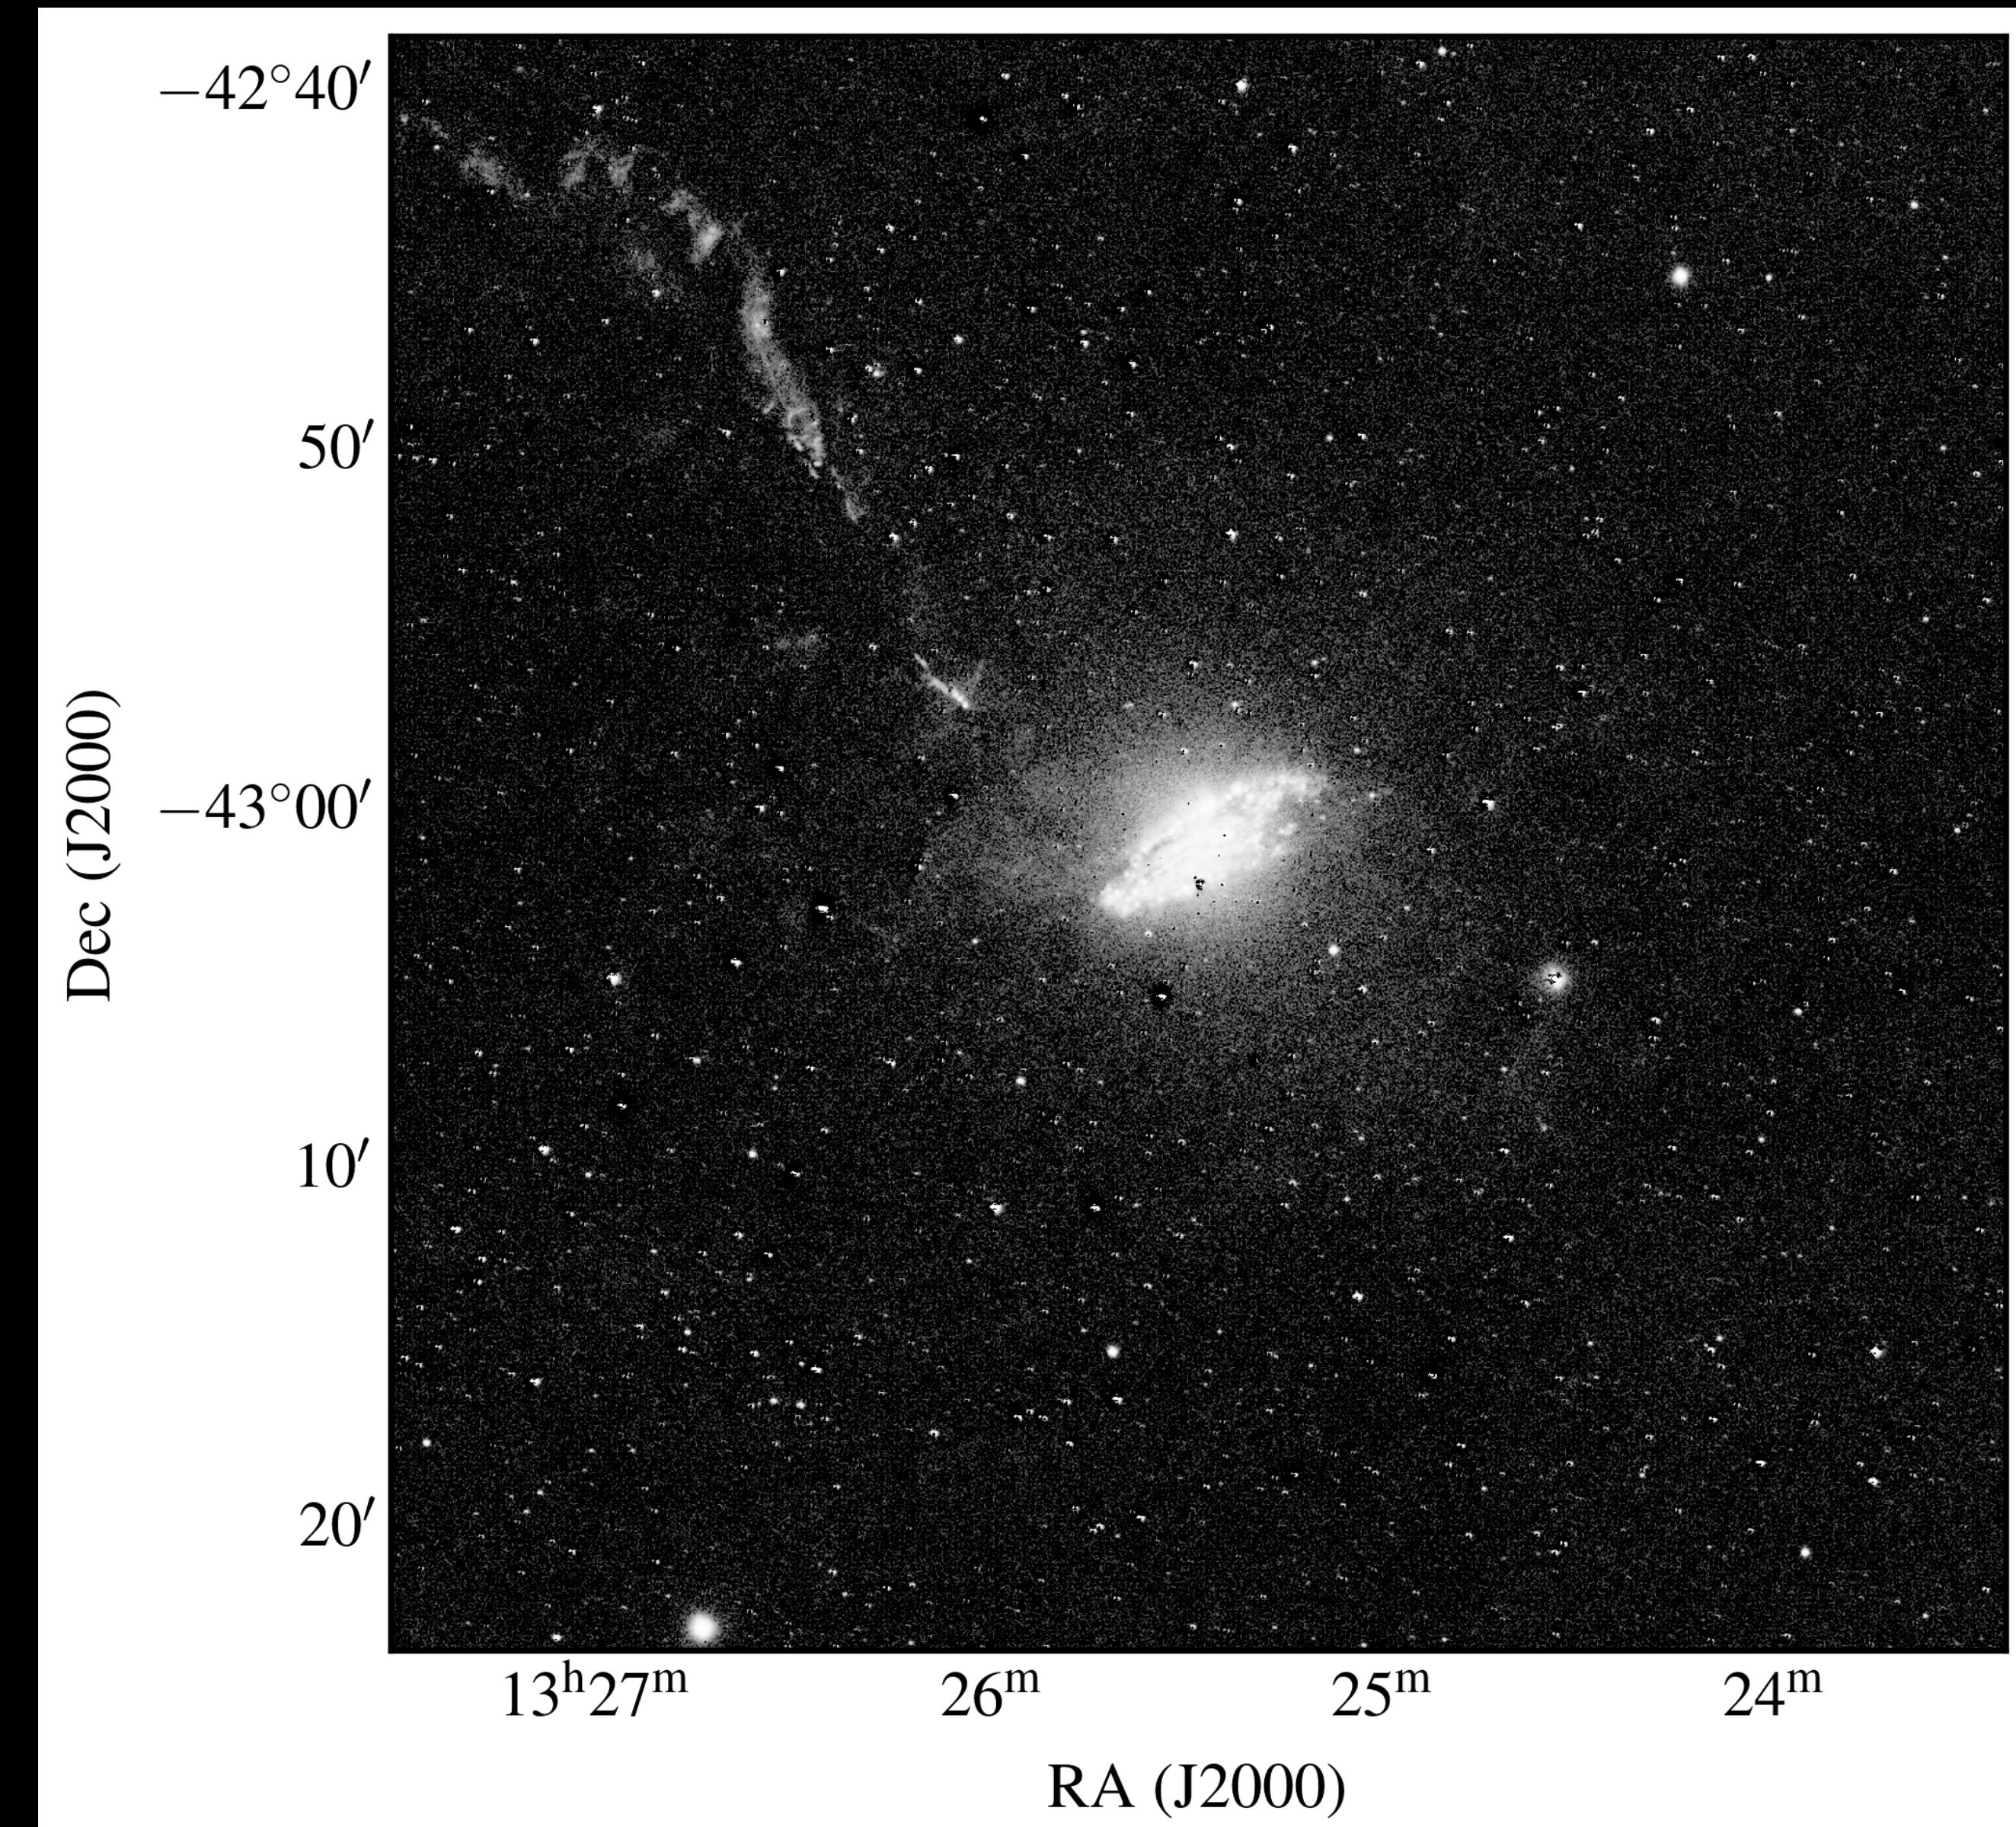

MeerKAT [Maccagni, McKinley in prep.]

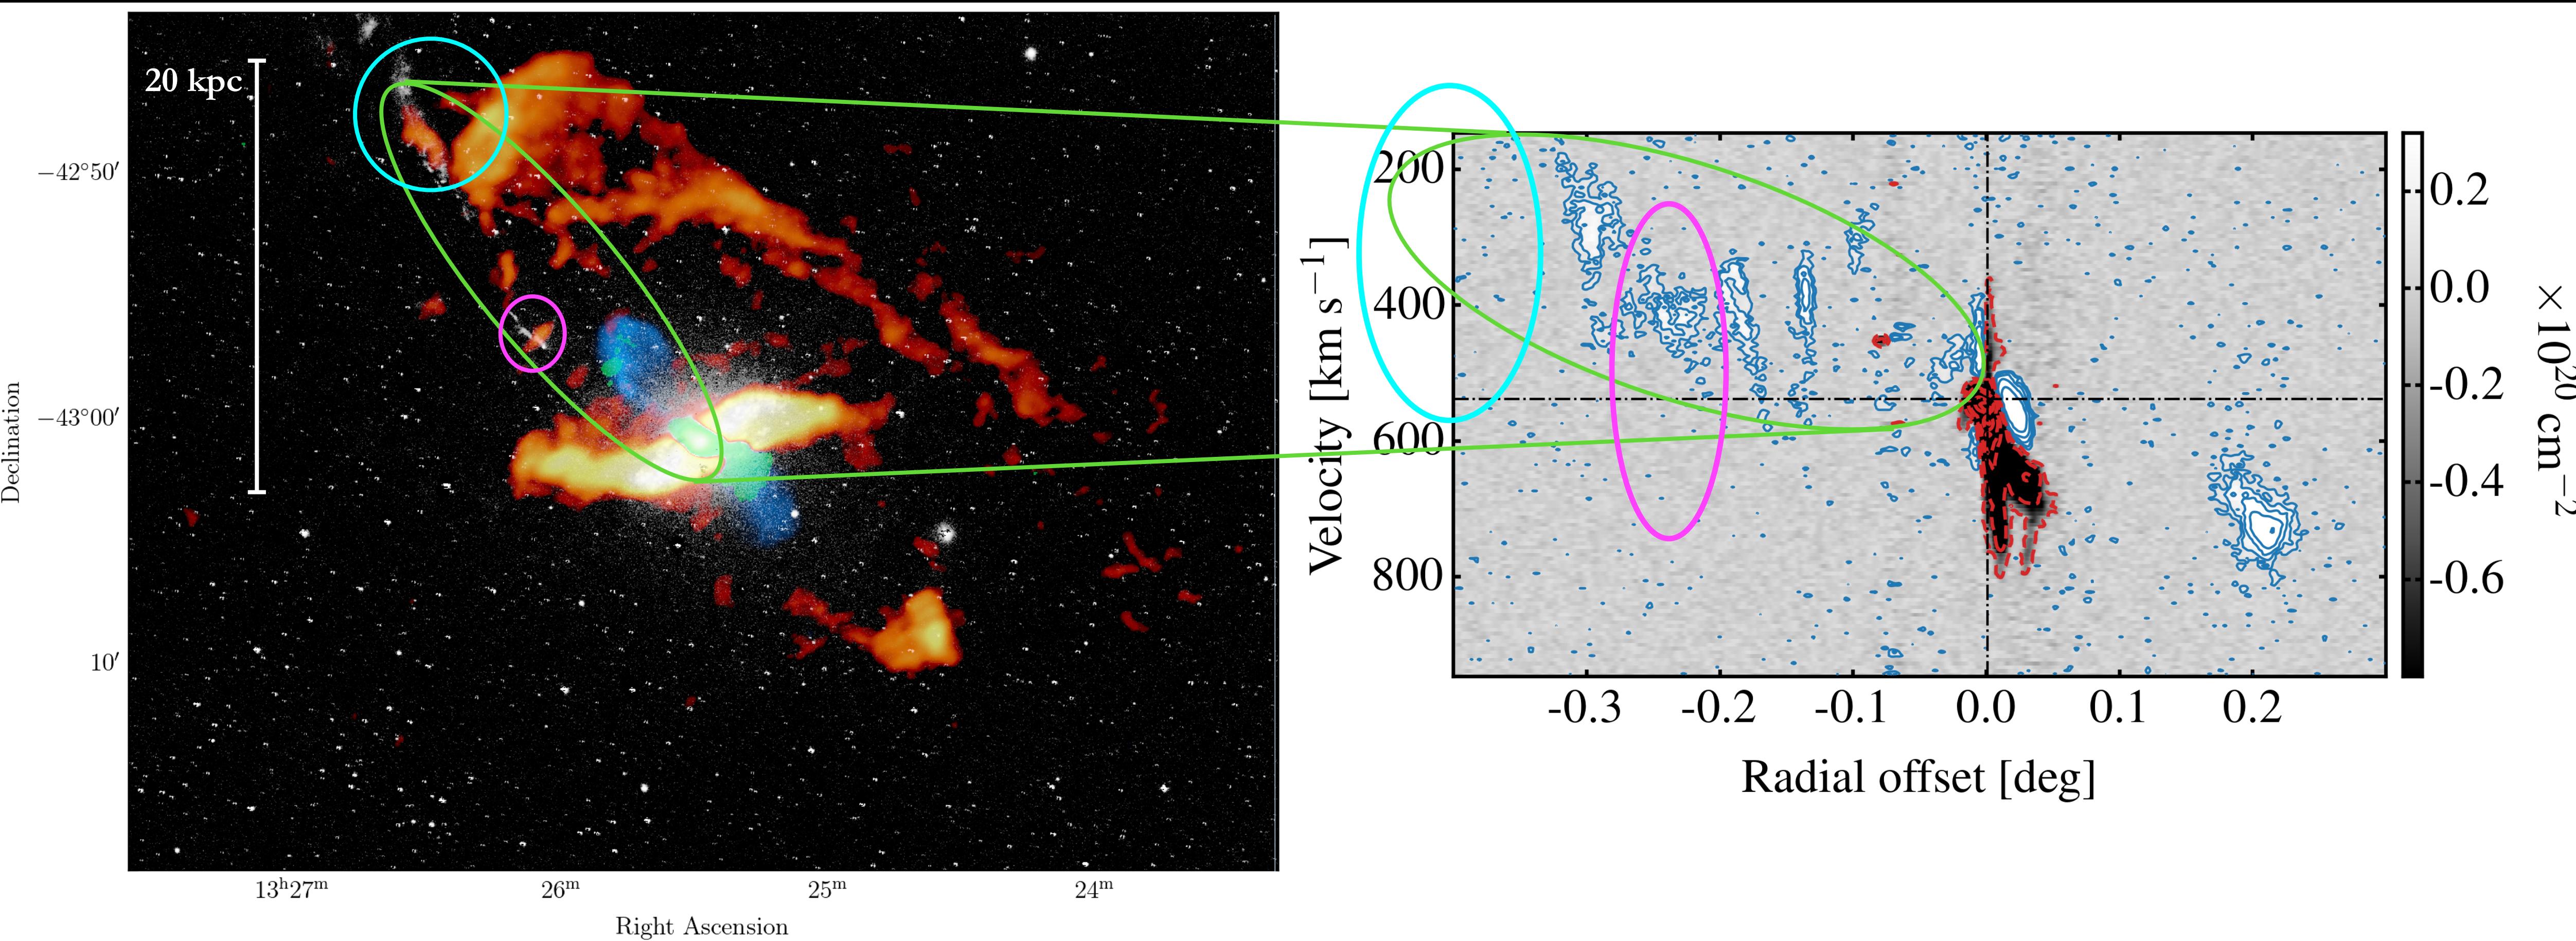

overlay courtesy of J. Healy

Centaurus A - H α filament

- Deep Narrowband Halpha photometry
- 50 hours Observations + flat fielding and sky subtraction made by **Mathew Ludgate** (astrophotographer)
- Nikon 400mm f2/8 lens + full frame mono camera. FOV = 5.15×3.44 deg, resolution $2''$.

Centaurus A - HI outflowing clouds along the H α filament

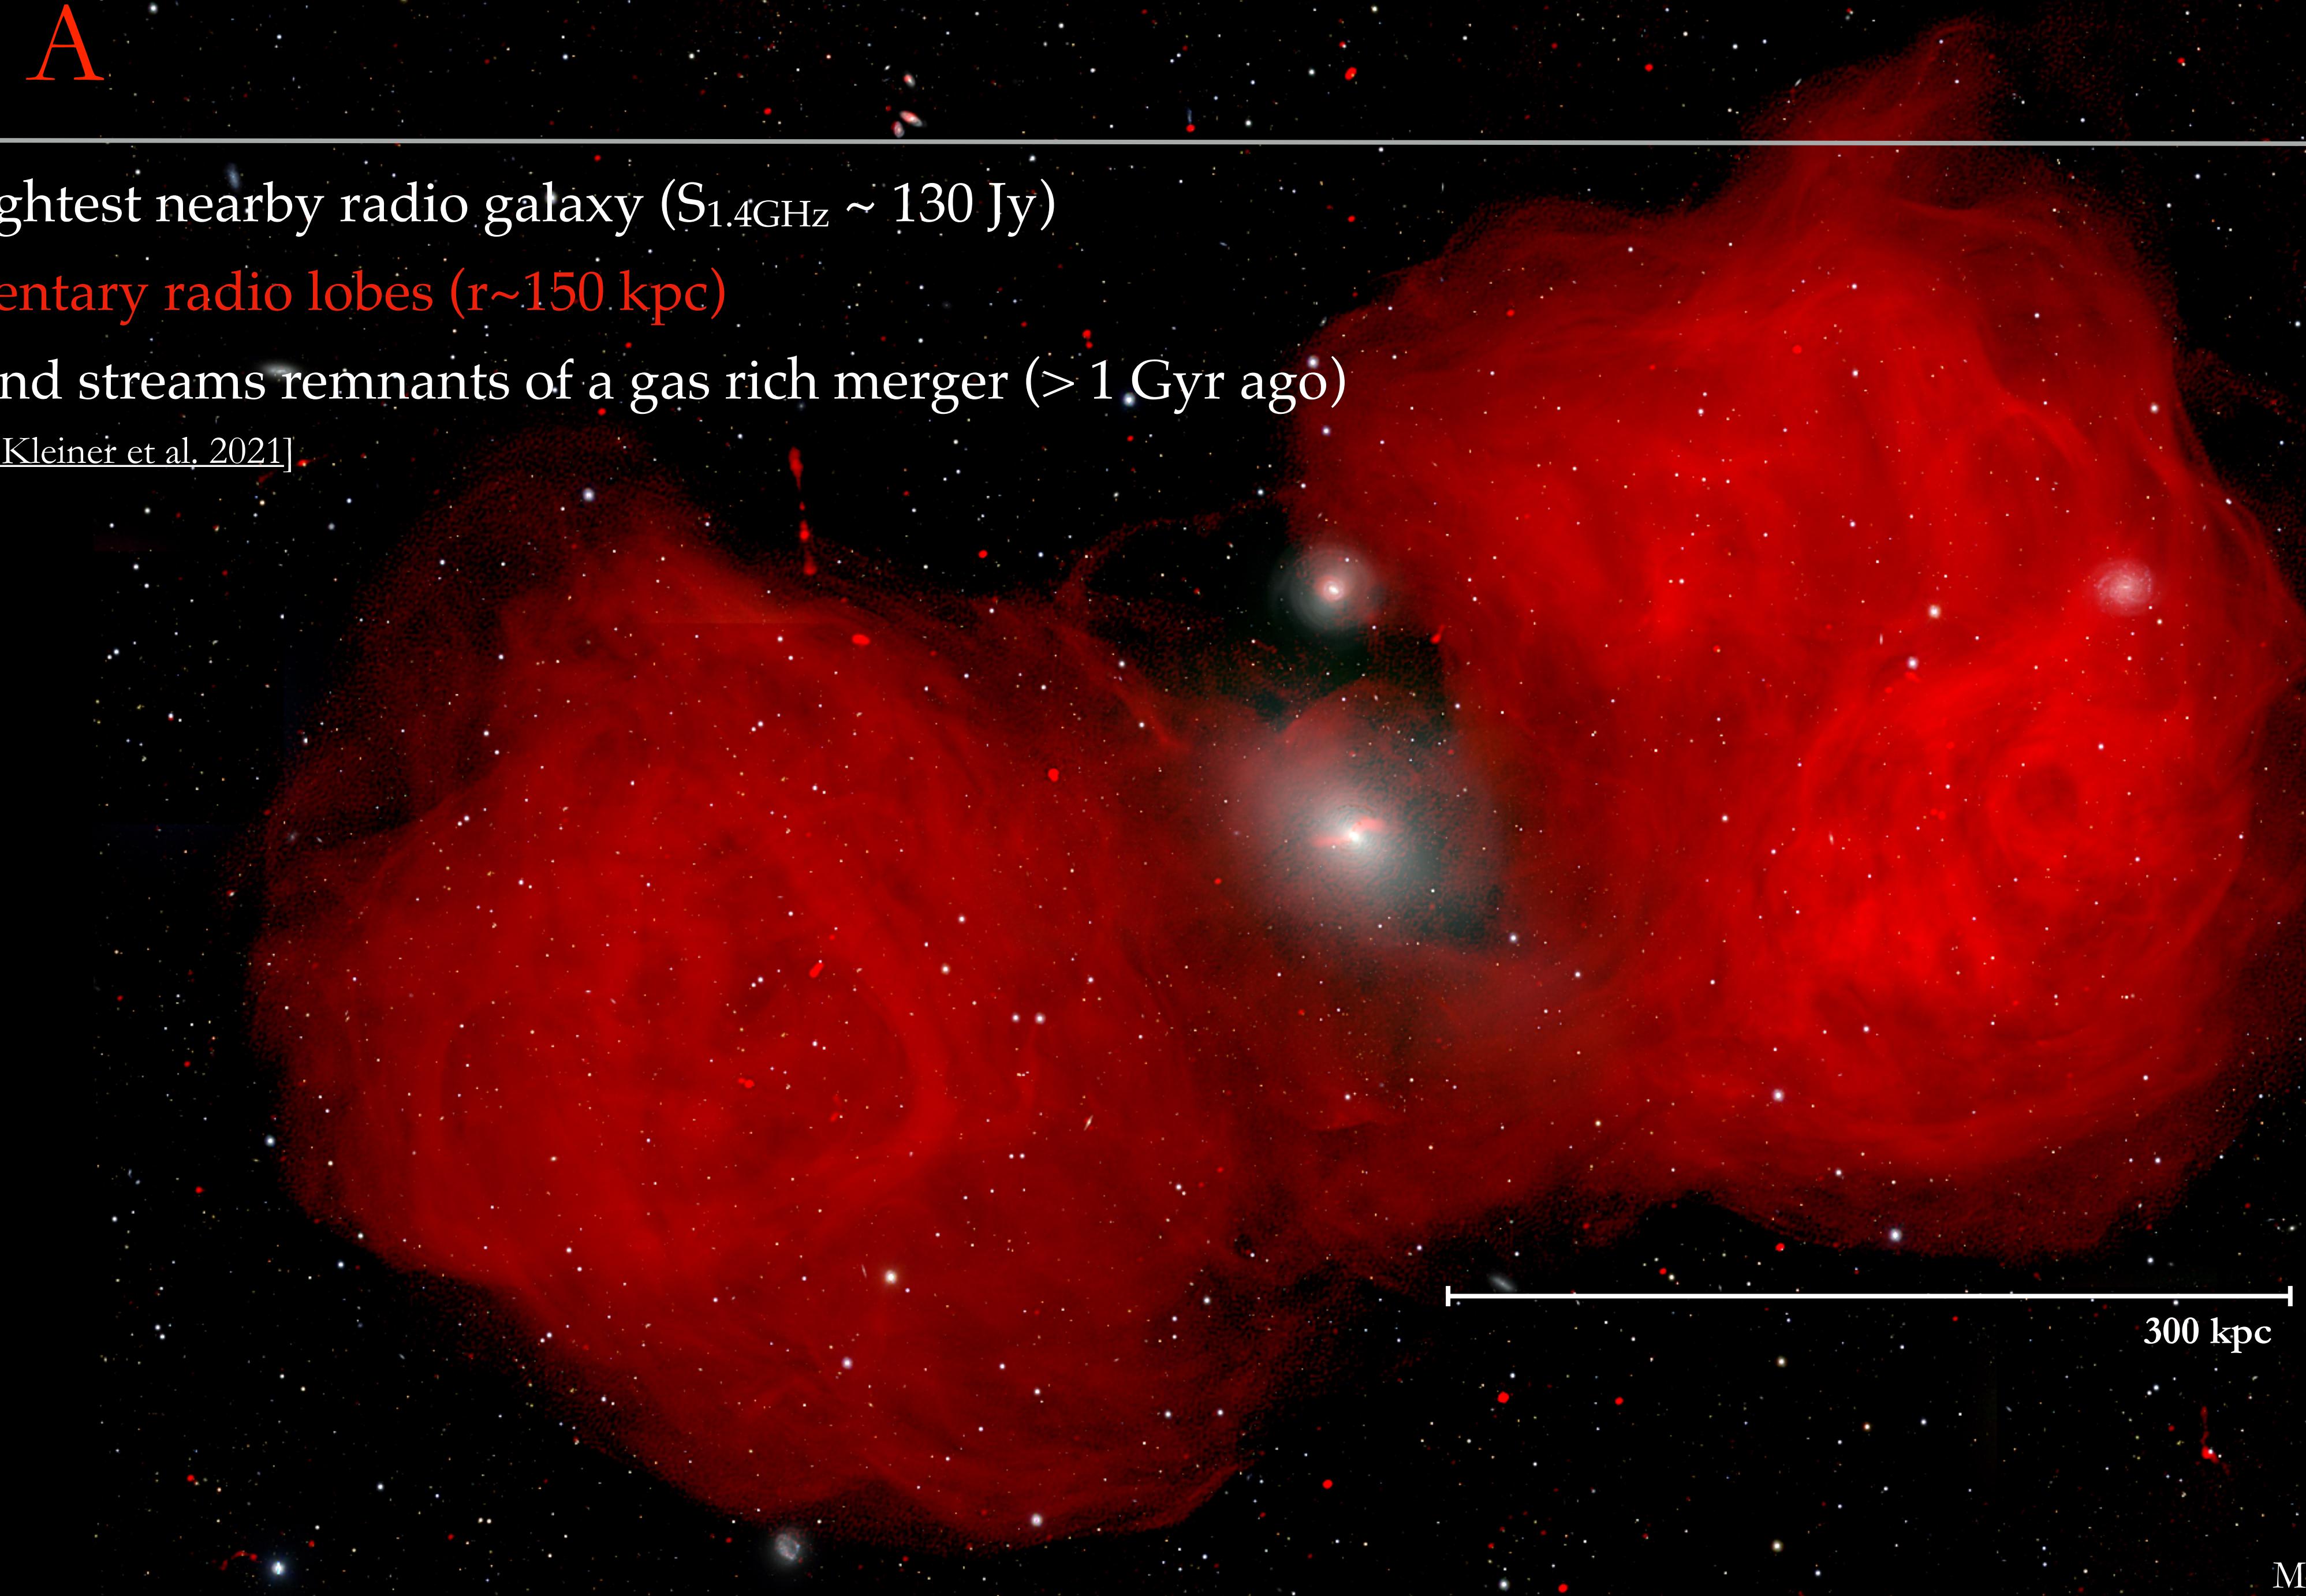

- **Coherent velocity outflow $\sim 200 \text{ km s}^{-1}$**
- **AGN jets slowly piercing through the HI disk, ionisation & enhanced SF?**

- Regions of AGN-triggered star formation show outflowing HI clouds ($M_{\text{HI-cloud}} \sim 10^6 M_\odot$)
 - Outer Filament, HI outflow extends for 2.5 kpc
 - Inner Filament, HI \perp to H α filament

Fornax A

- 3rd near brightest nearby radio galaxy ($S_{1.4\text{GHz}} \sim 130 \text{ Jy}$)
- Giant filamentary radio lobes ($r \sim 150 \text{ kpc}$)
- HI clouds and streams remnants of a gas rich merger ($> 1 \text{ Gyr ago}$)

[Serra, et al. 2019, Kleiner et al. 2021]

Fornax A - radio and HI

- How did the radio lobes and inner jets form? in which timescales?
- Is the HI fuelling the nuclear activity of Fornax A?
- Is AGN feedback changing the conditions of the ISM and IGM?

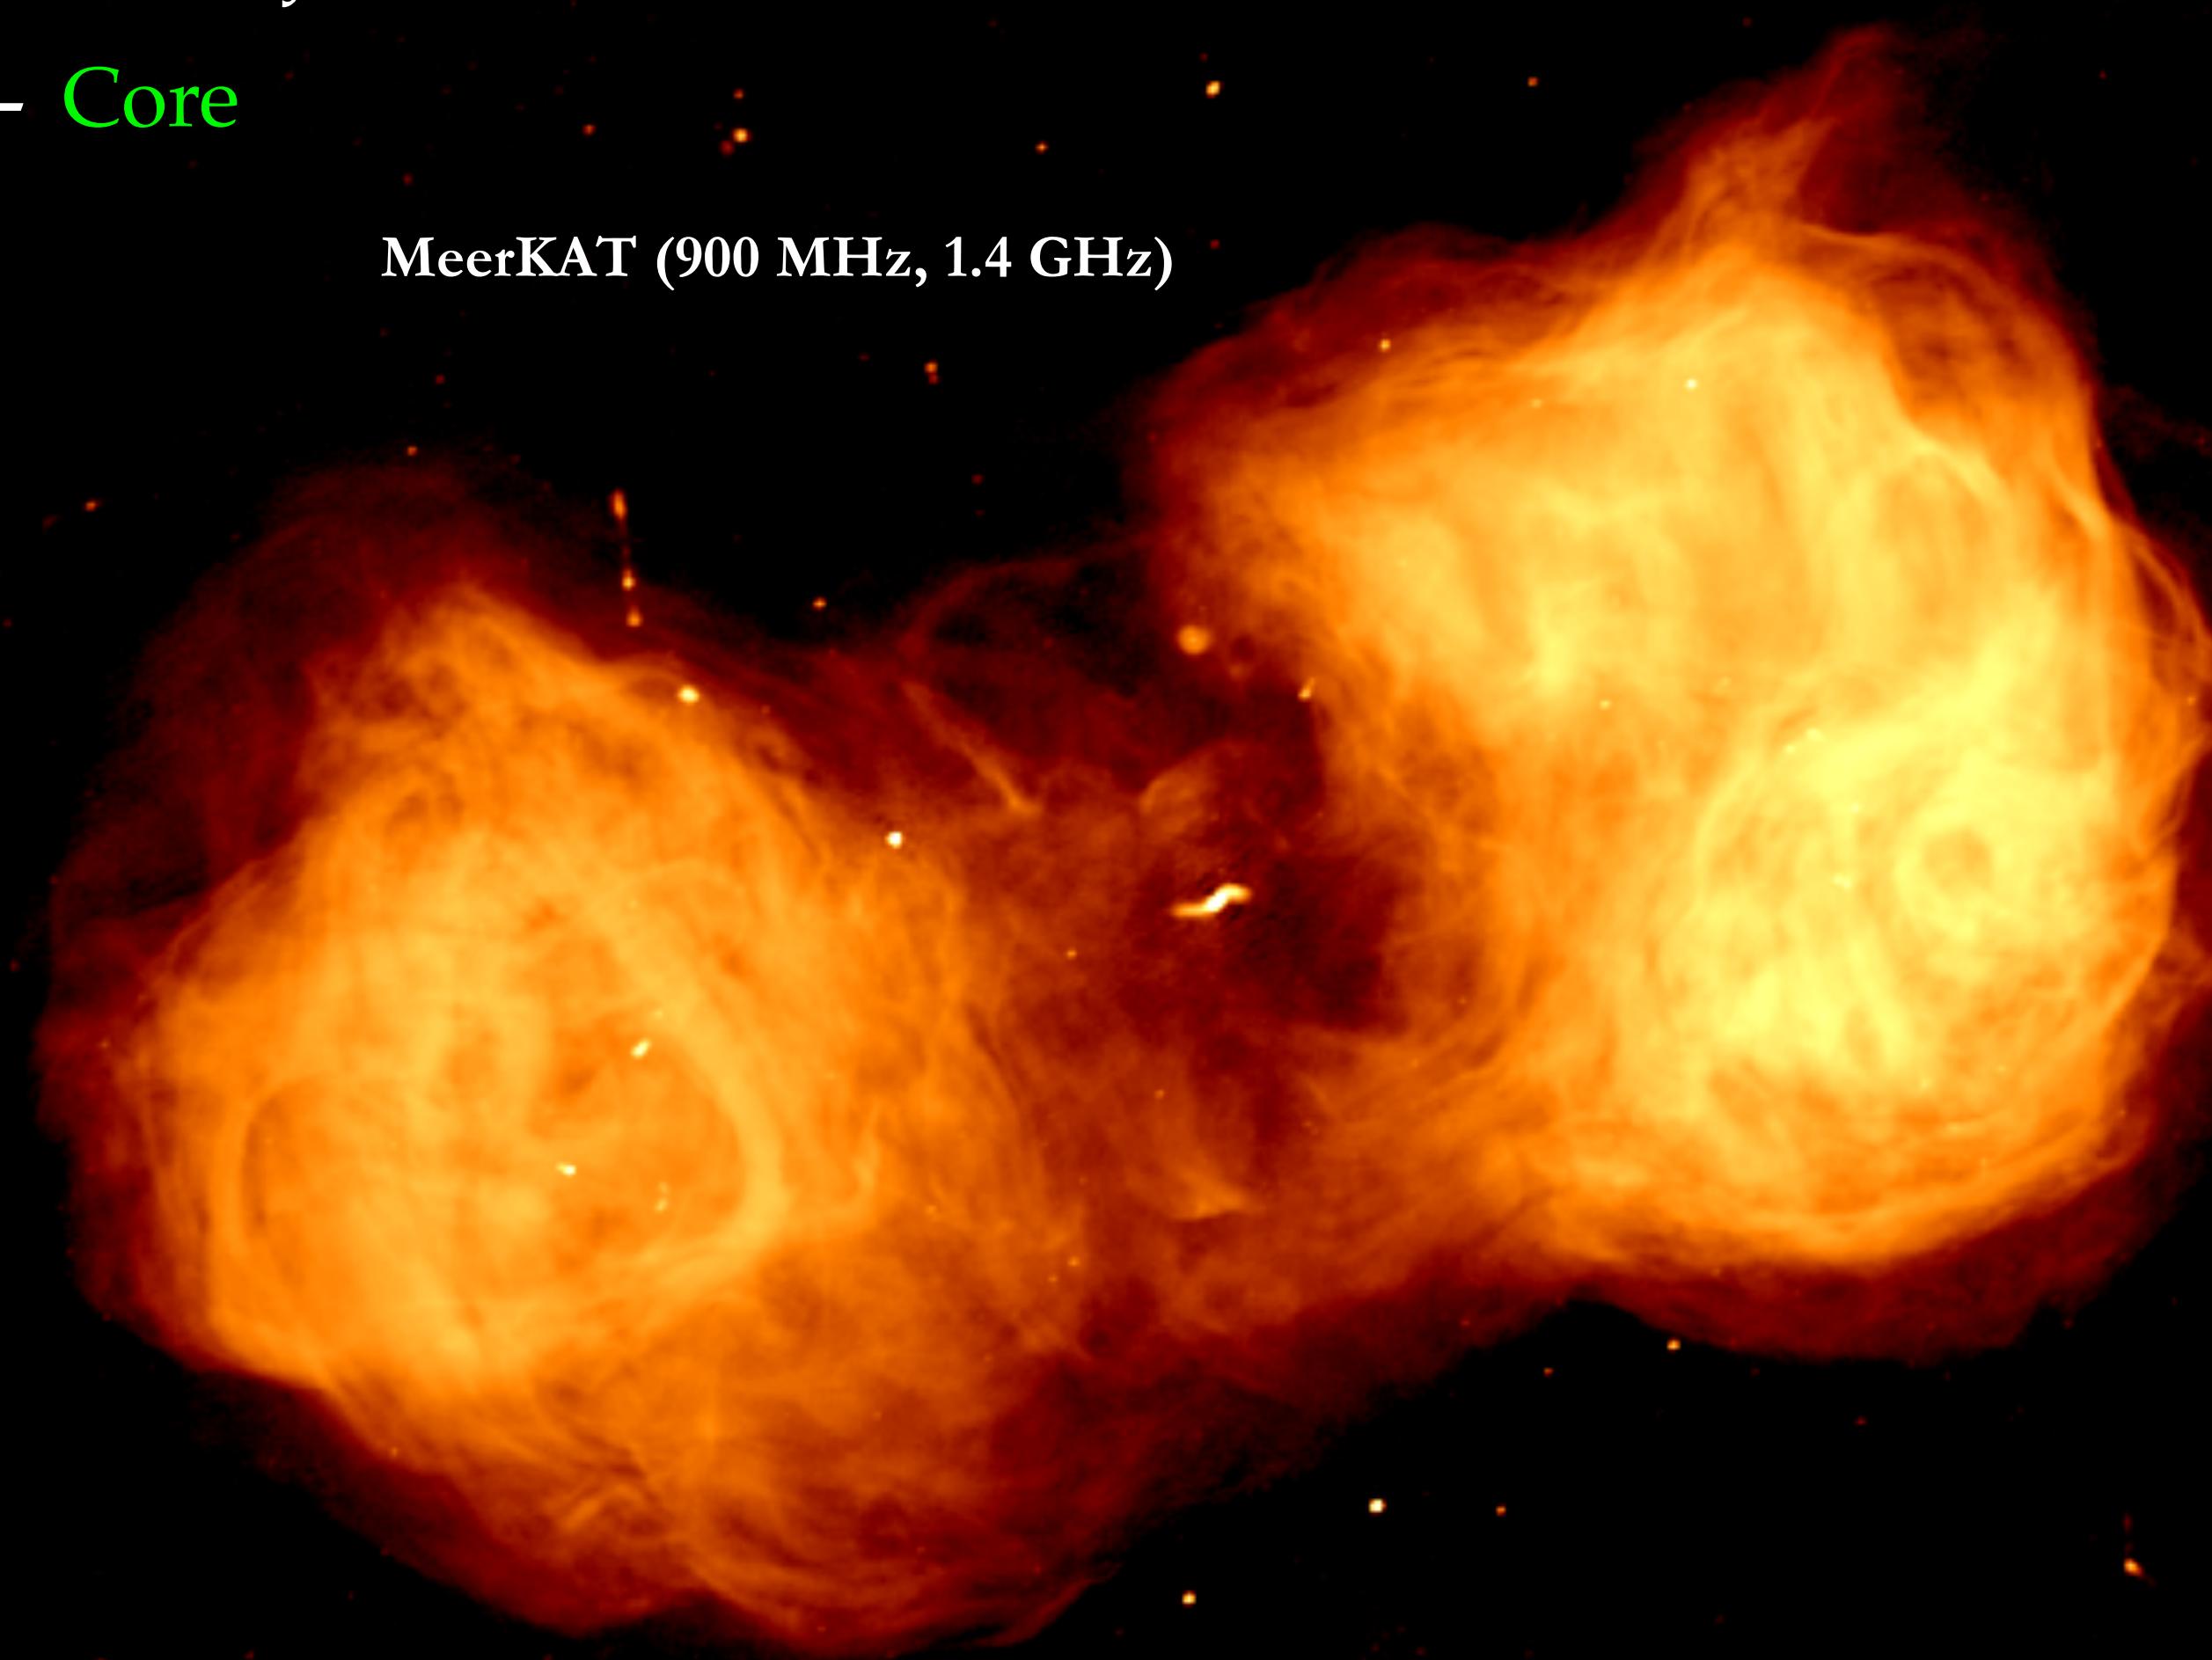

Fornax A - broadband radio continuum

Characterize the duty cycle of the AGN:

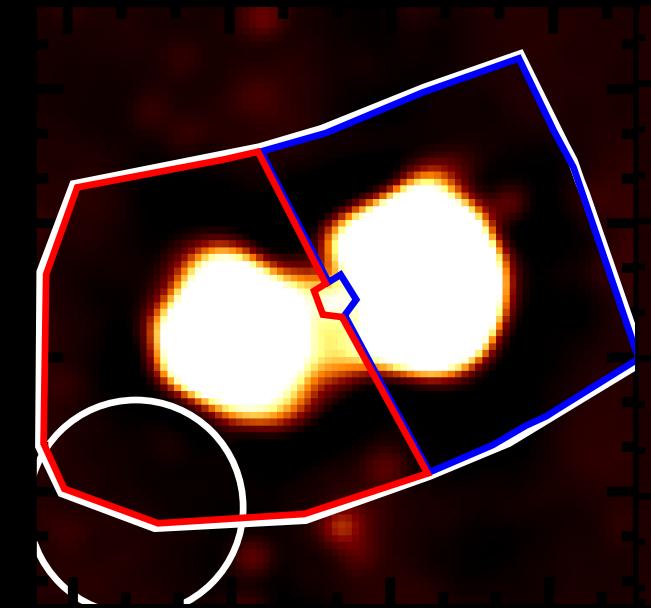

Spectral flux density distribution

- East & West Lobe
- Inner Jets
- Core

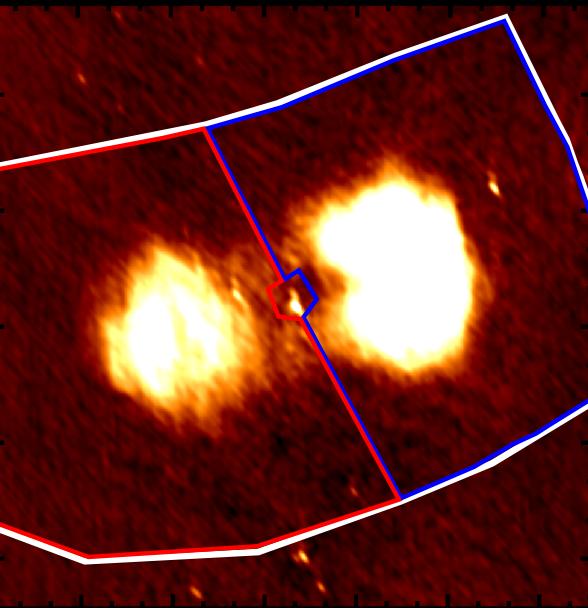

MeerKAT (900 MHz, 1.4 GHz)

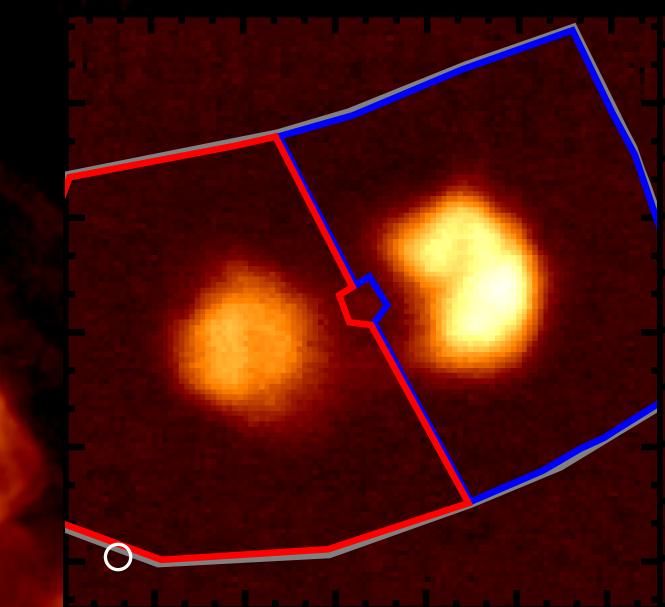

MWA (84 - 200 MHz)

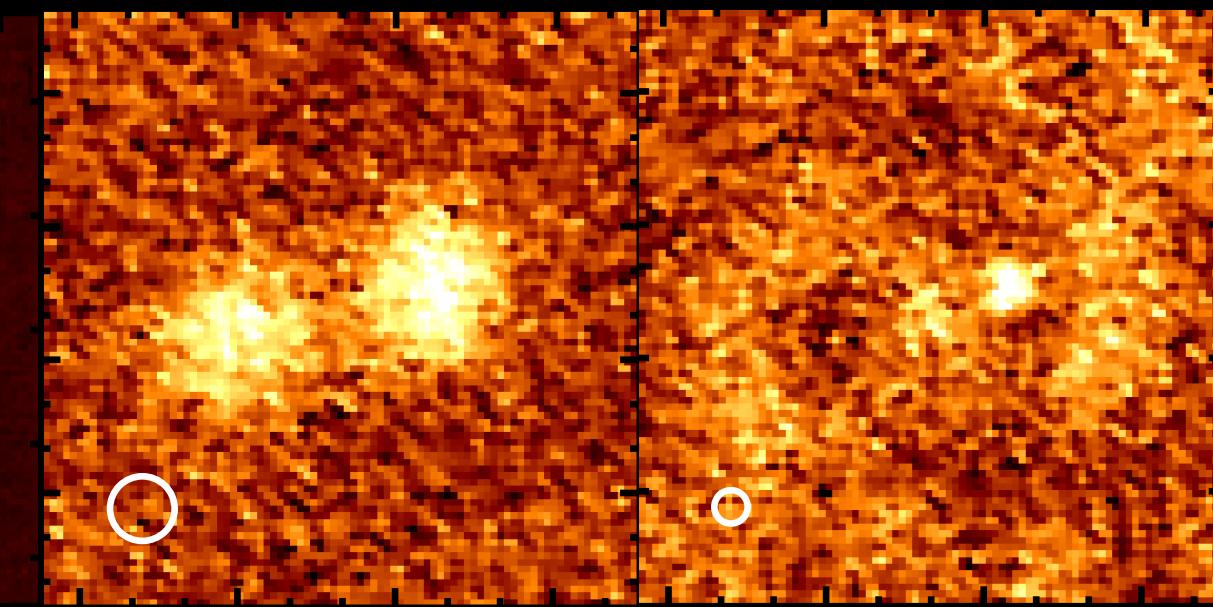

VLA (320 MHz)

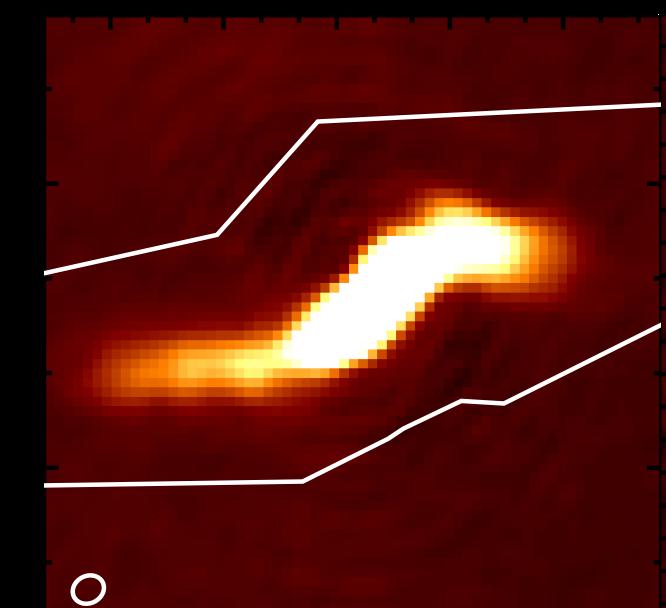

SRT (5.7-6.8 GHz)

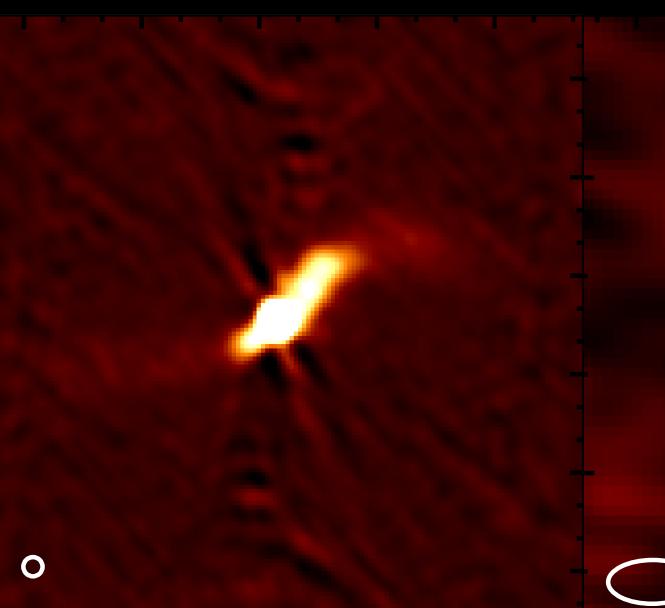

Planck (30 - 217 GHz)

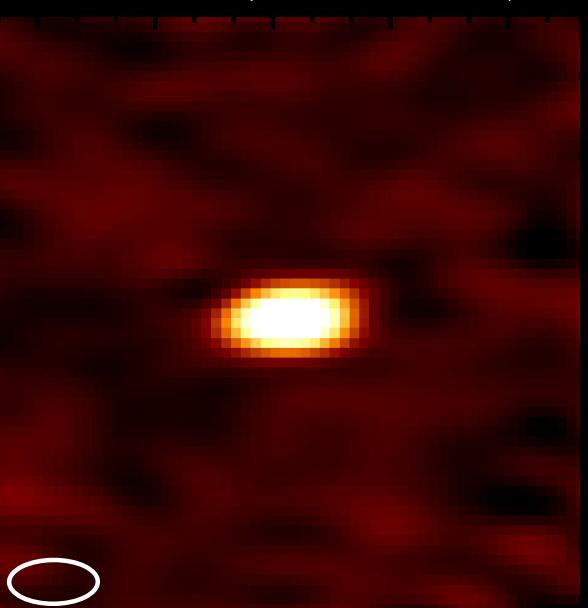

MeerKAT (1.4 GHz)

VLA (4.8 GHz)

ALMA (108 GHz)

Fornax A - AGN flickering activity

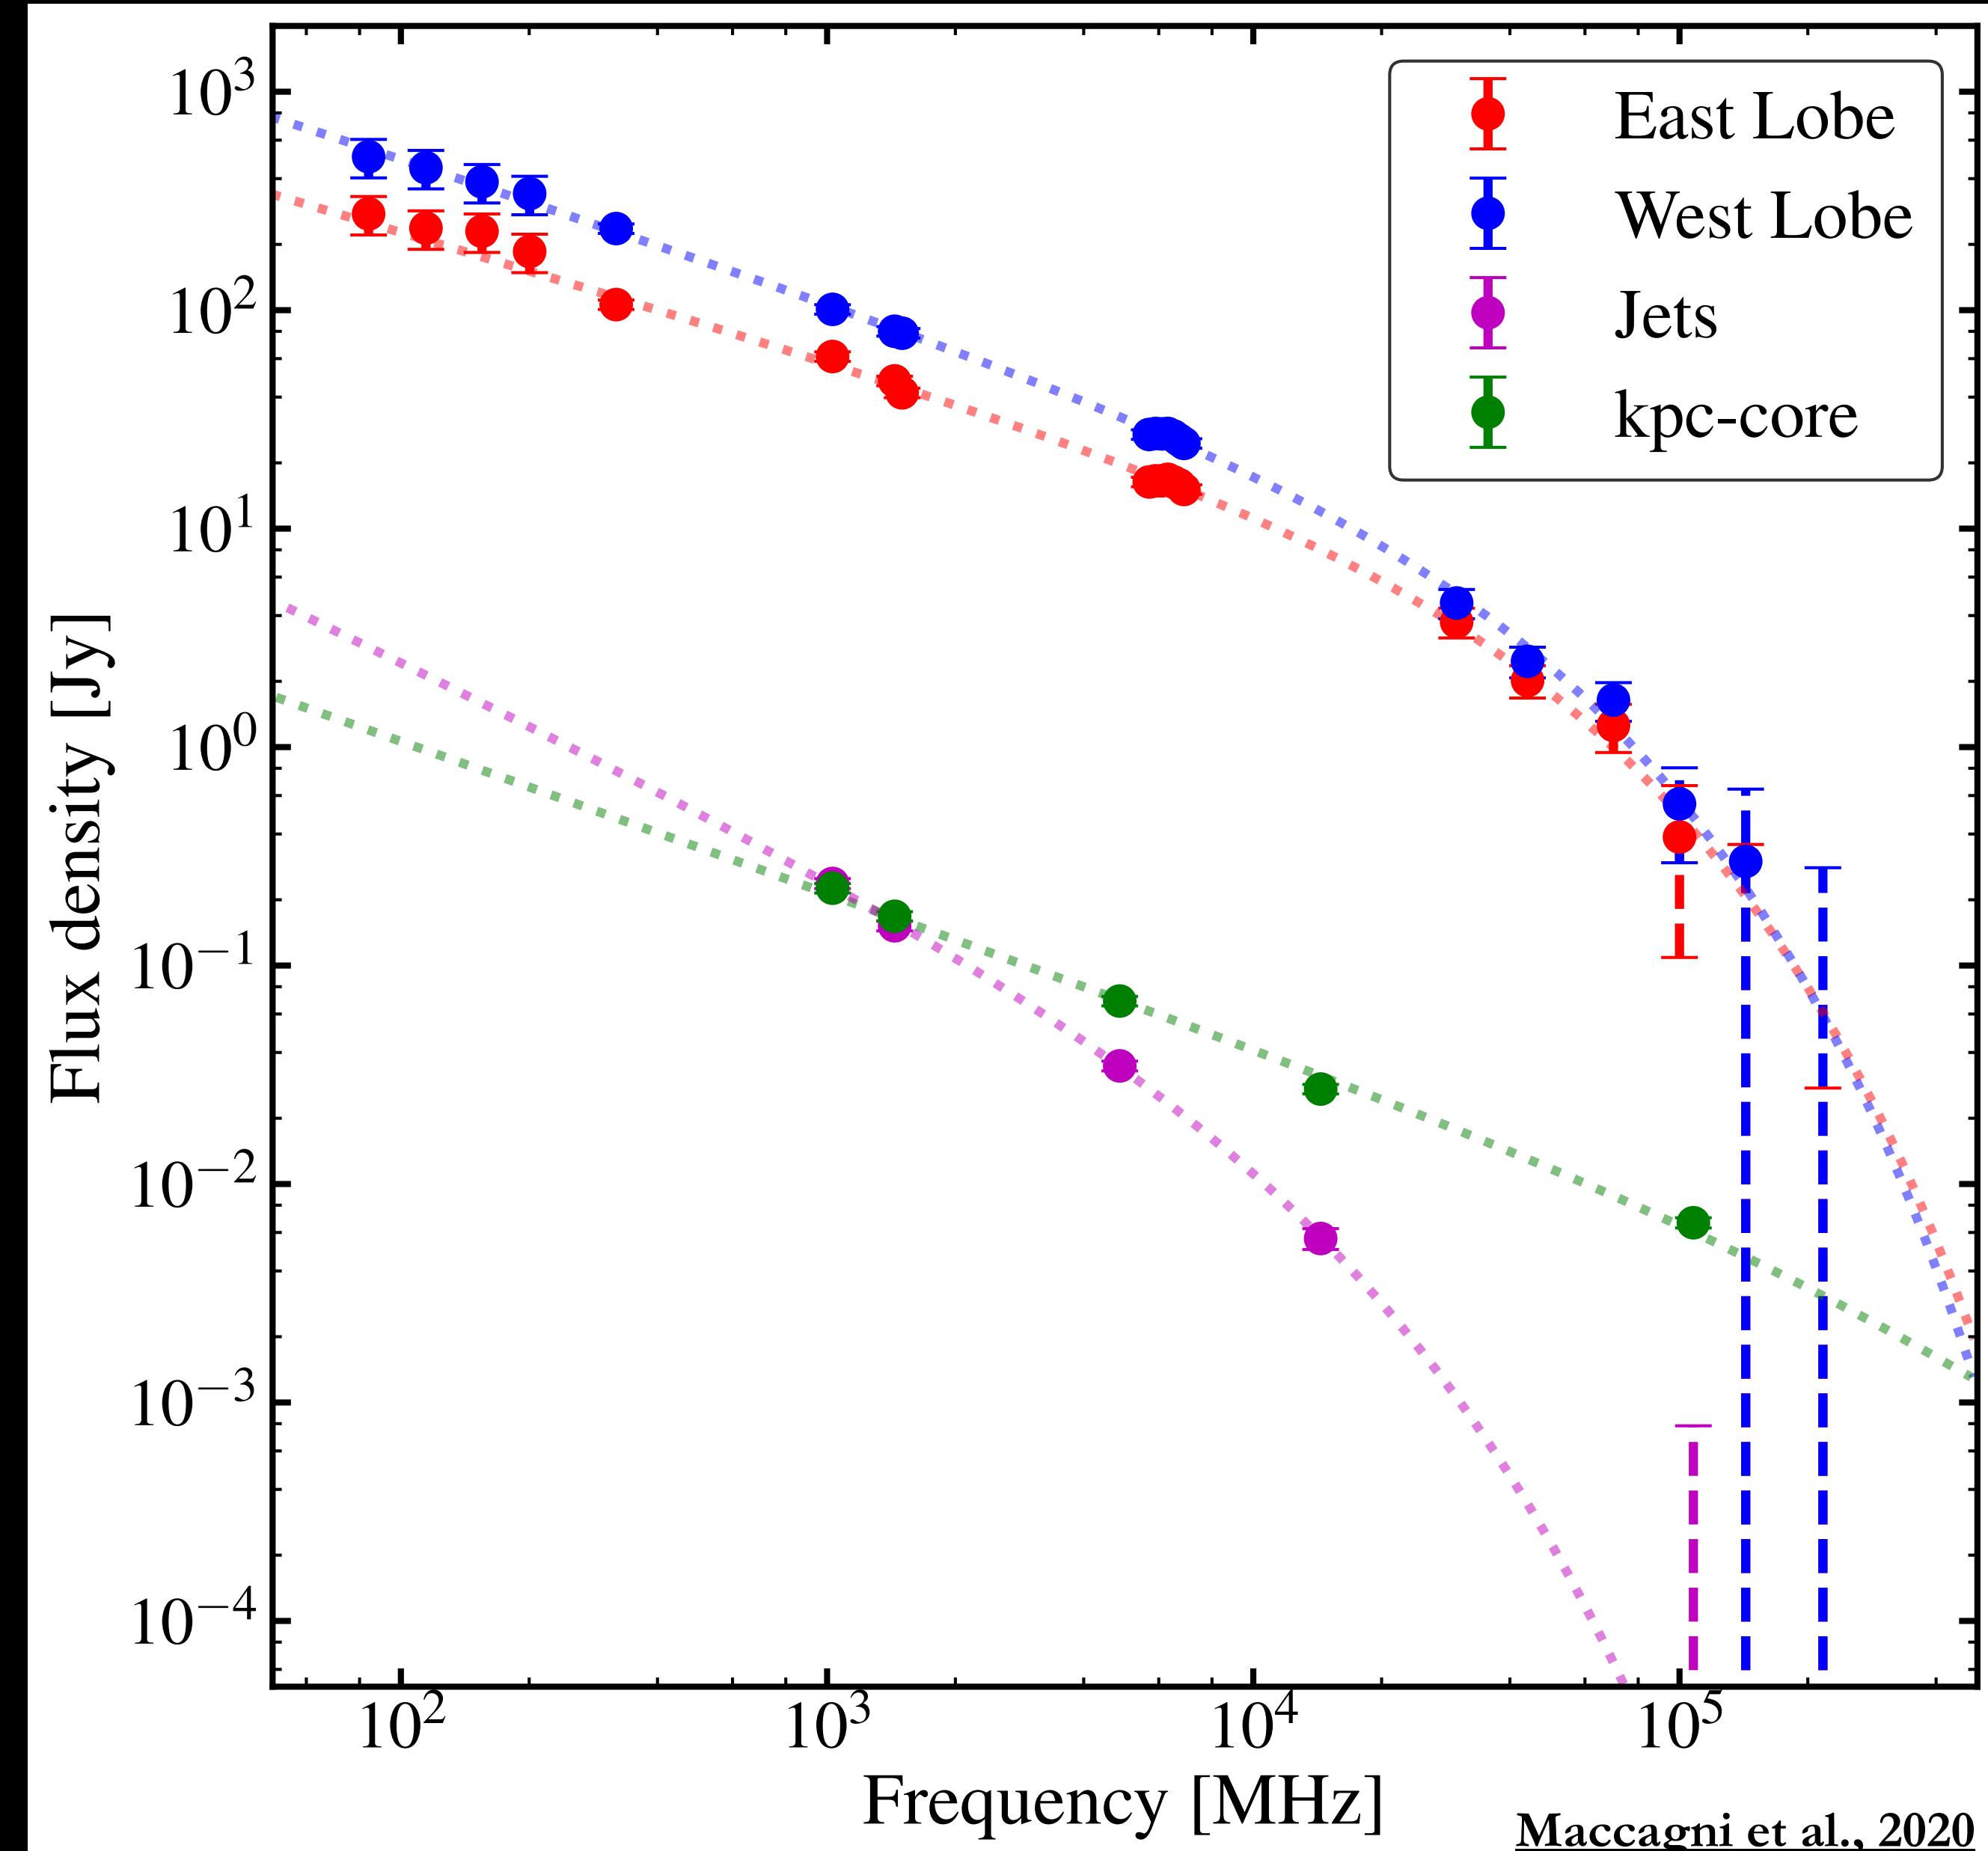

- **Phase 1 — Lobes**
- 24 Myr ago began the last injection of the lobes
- 12 Myr ago AGN switch-off

- **Phase 2 — Jets**
- 3 Myr ago AGN formed the jets
- 1 Myr ago AGN switch-off

- **Phase 3 — Core**
- kpc-core may be active (< 1 Myr)

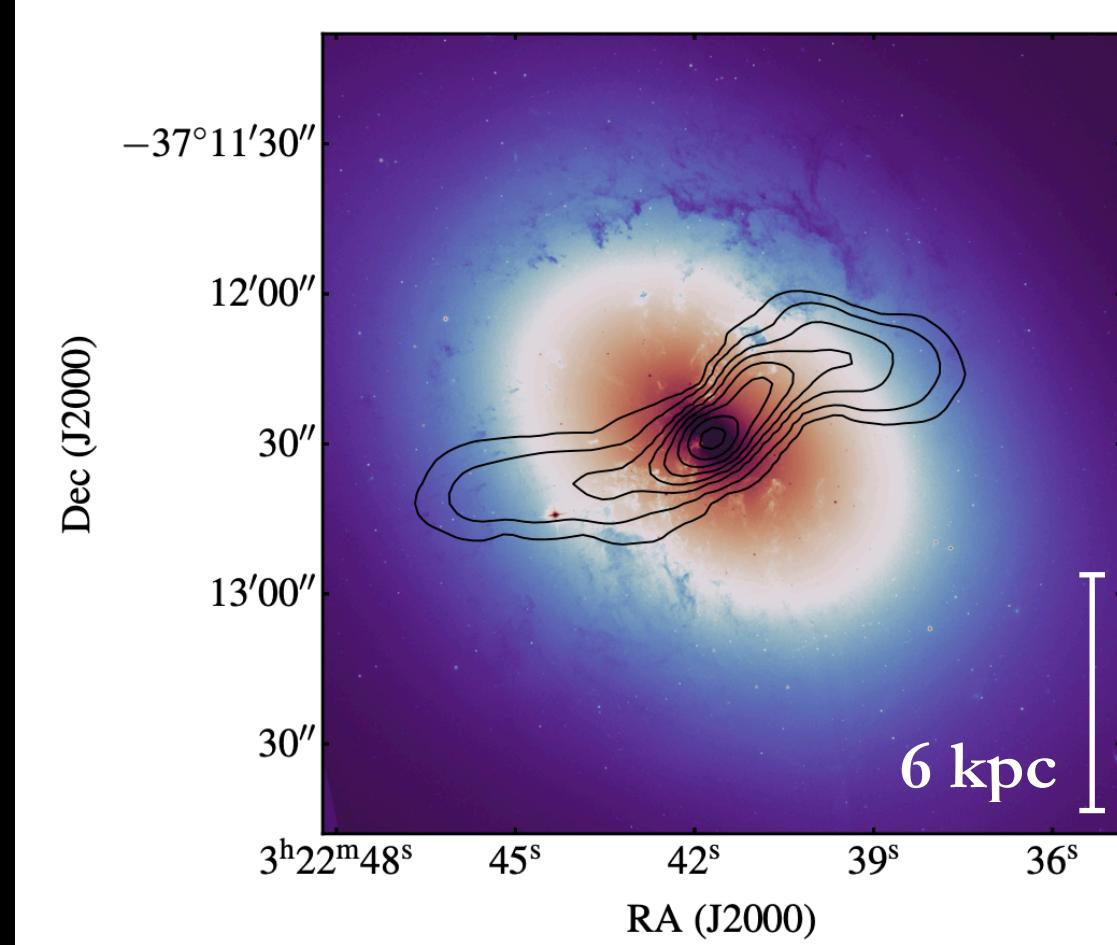

What regulates the fast duty cycle?

merger 1 Gyr: did not trigger the latest phases of the AGN but brought turbulent gas and filaments

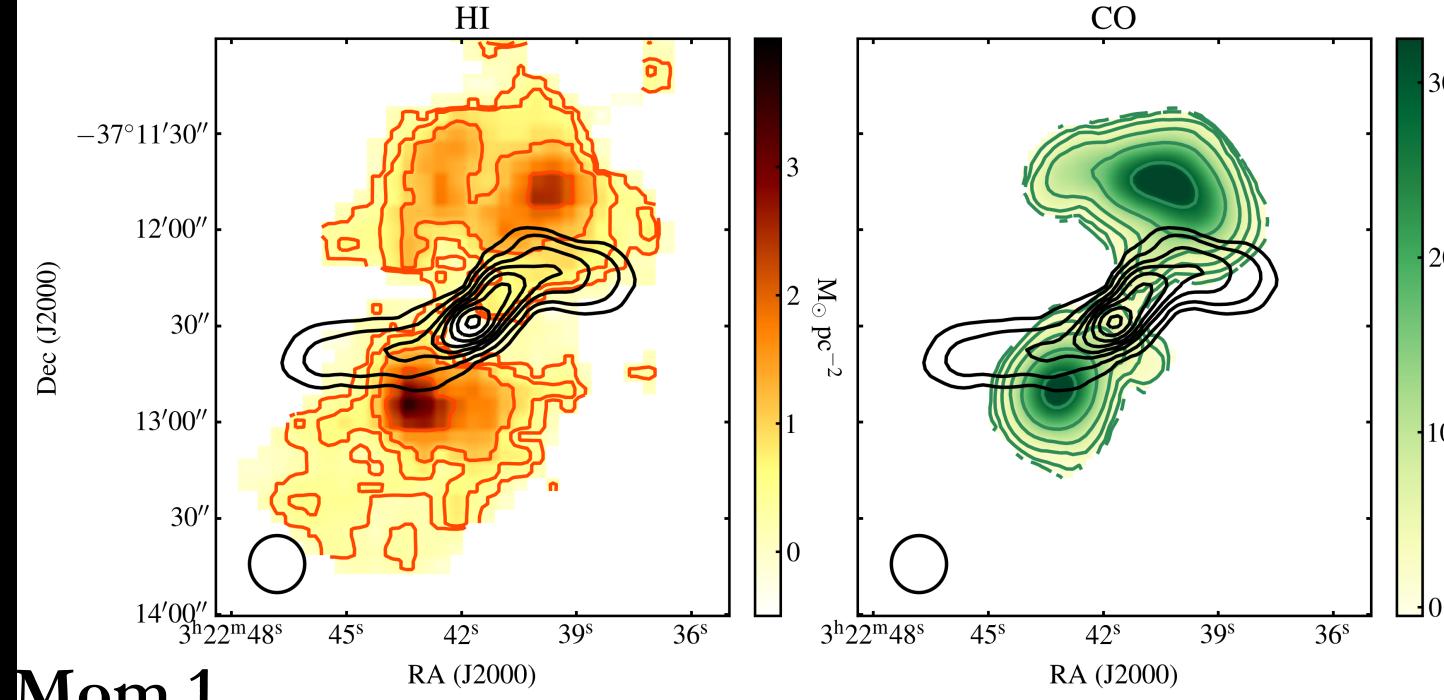

Fornax A - Central cold gas distribution and kinematics

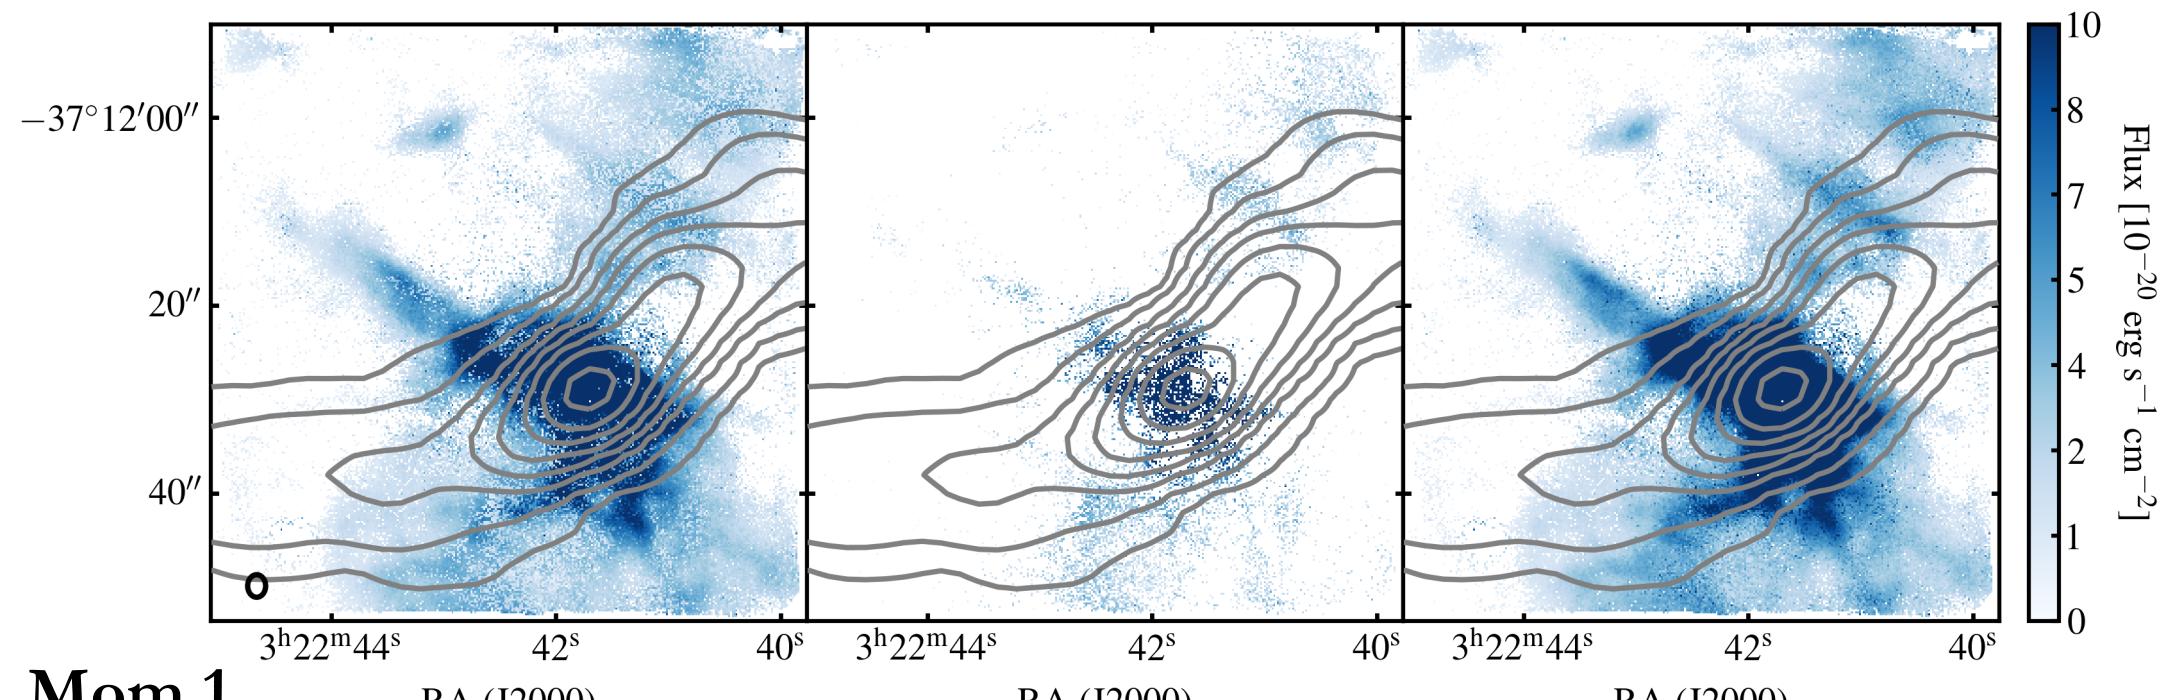

Dust

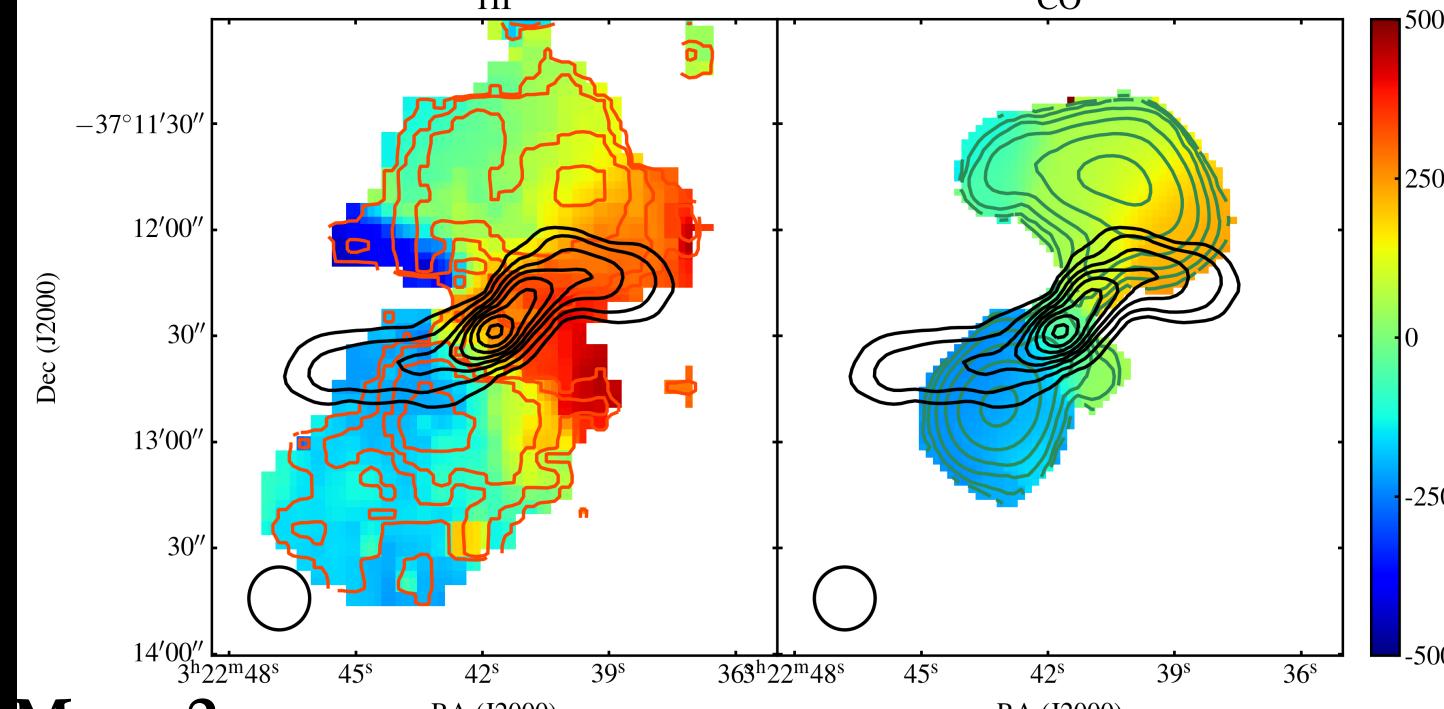

HI, CO (1-0) — Mom 0

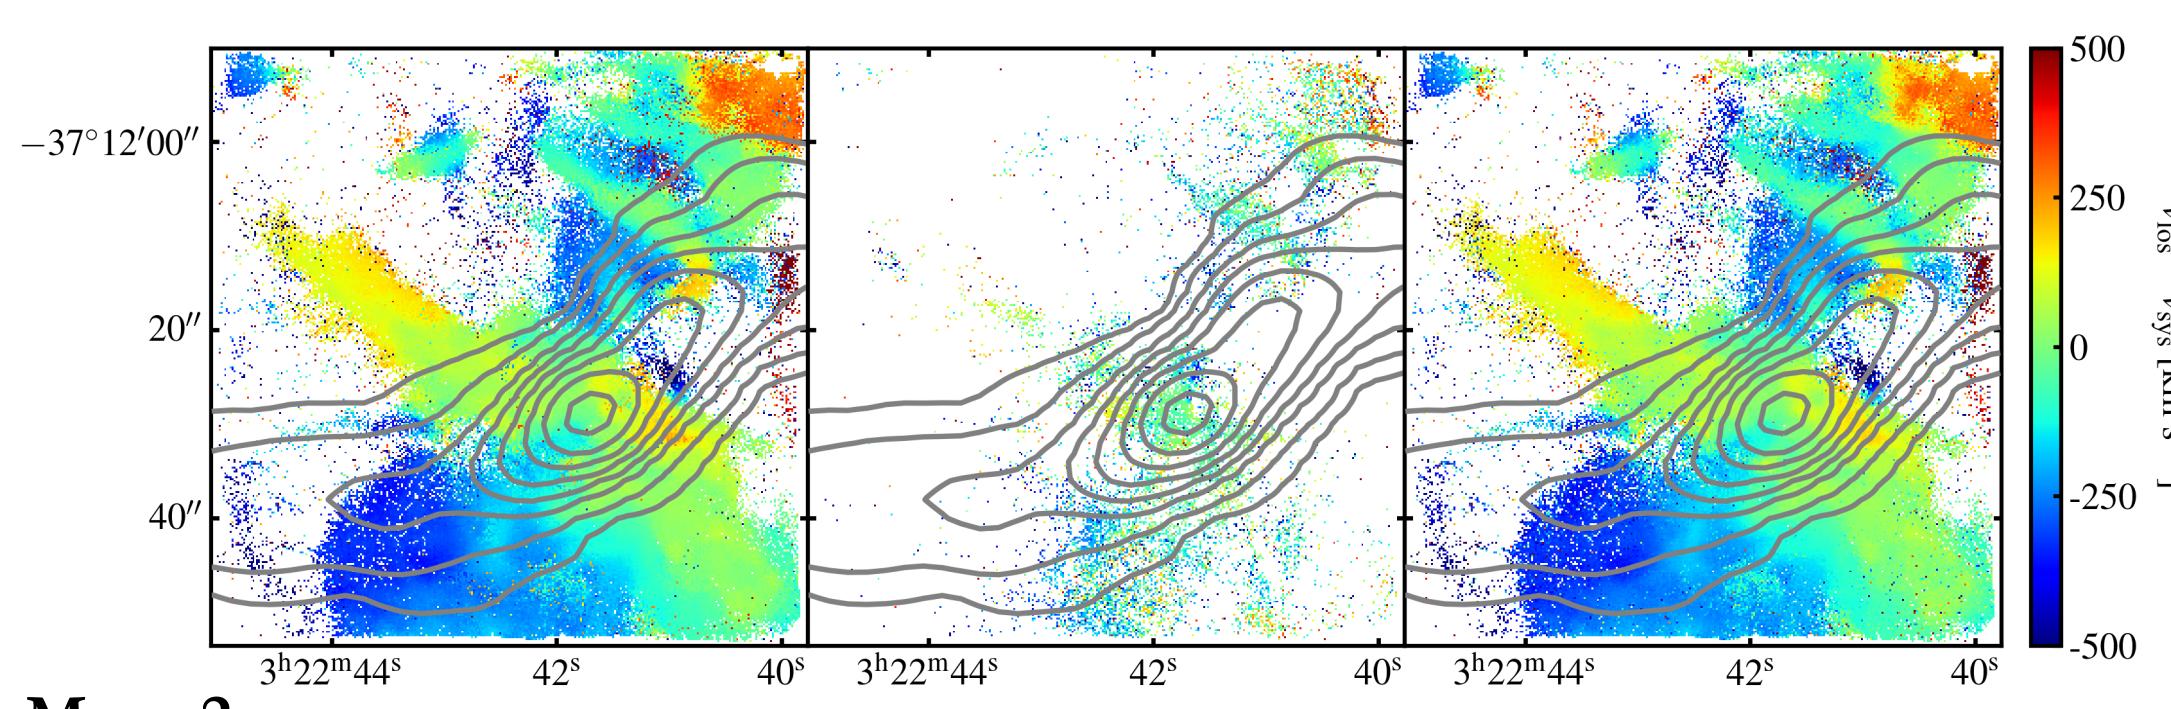

[NII]6583 — Mom 0

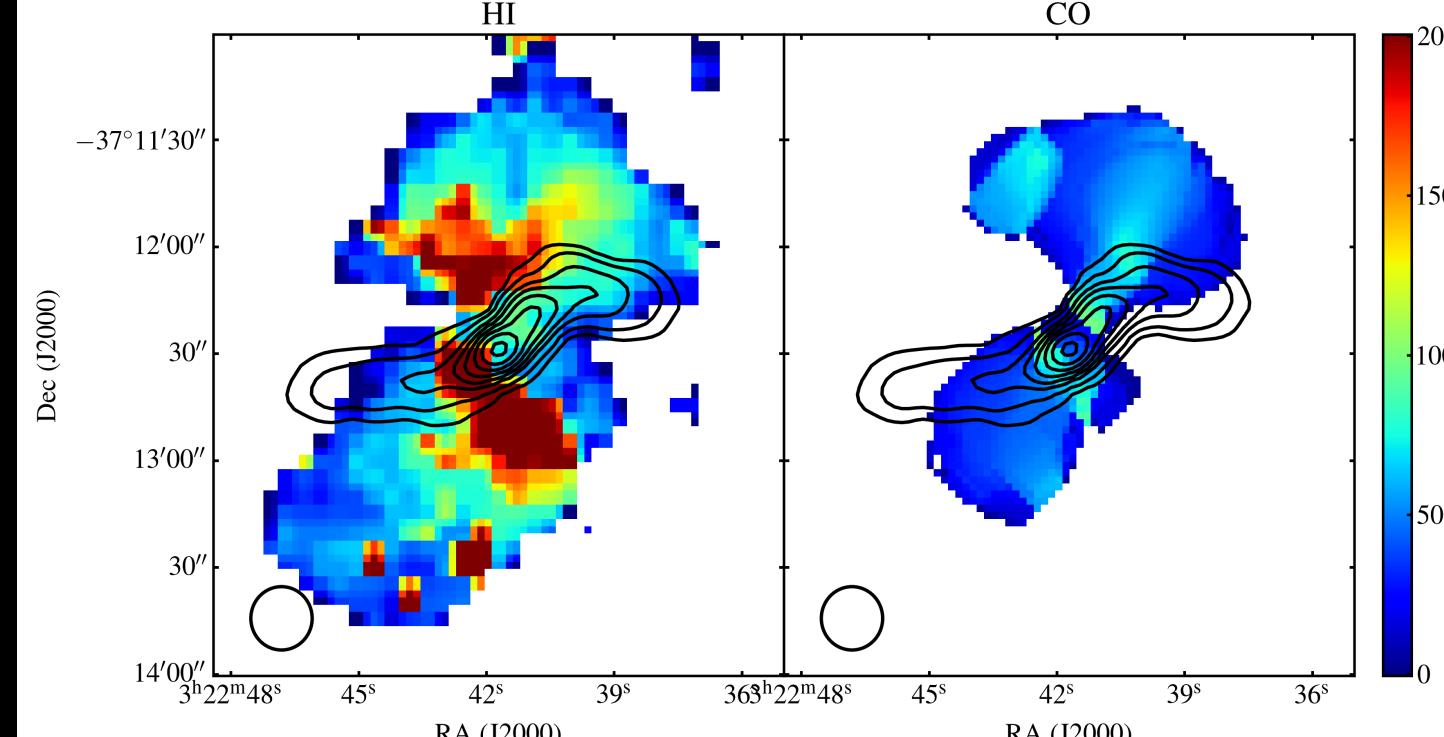

Mom 1

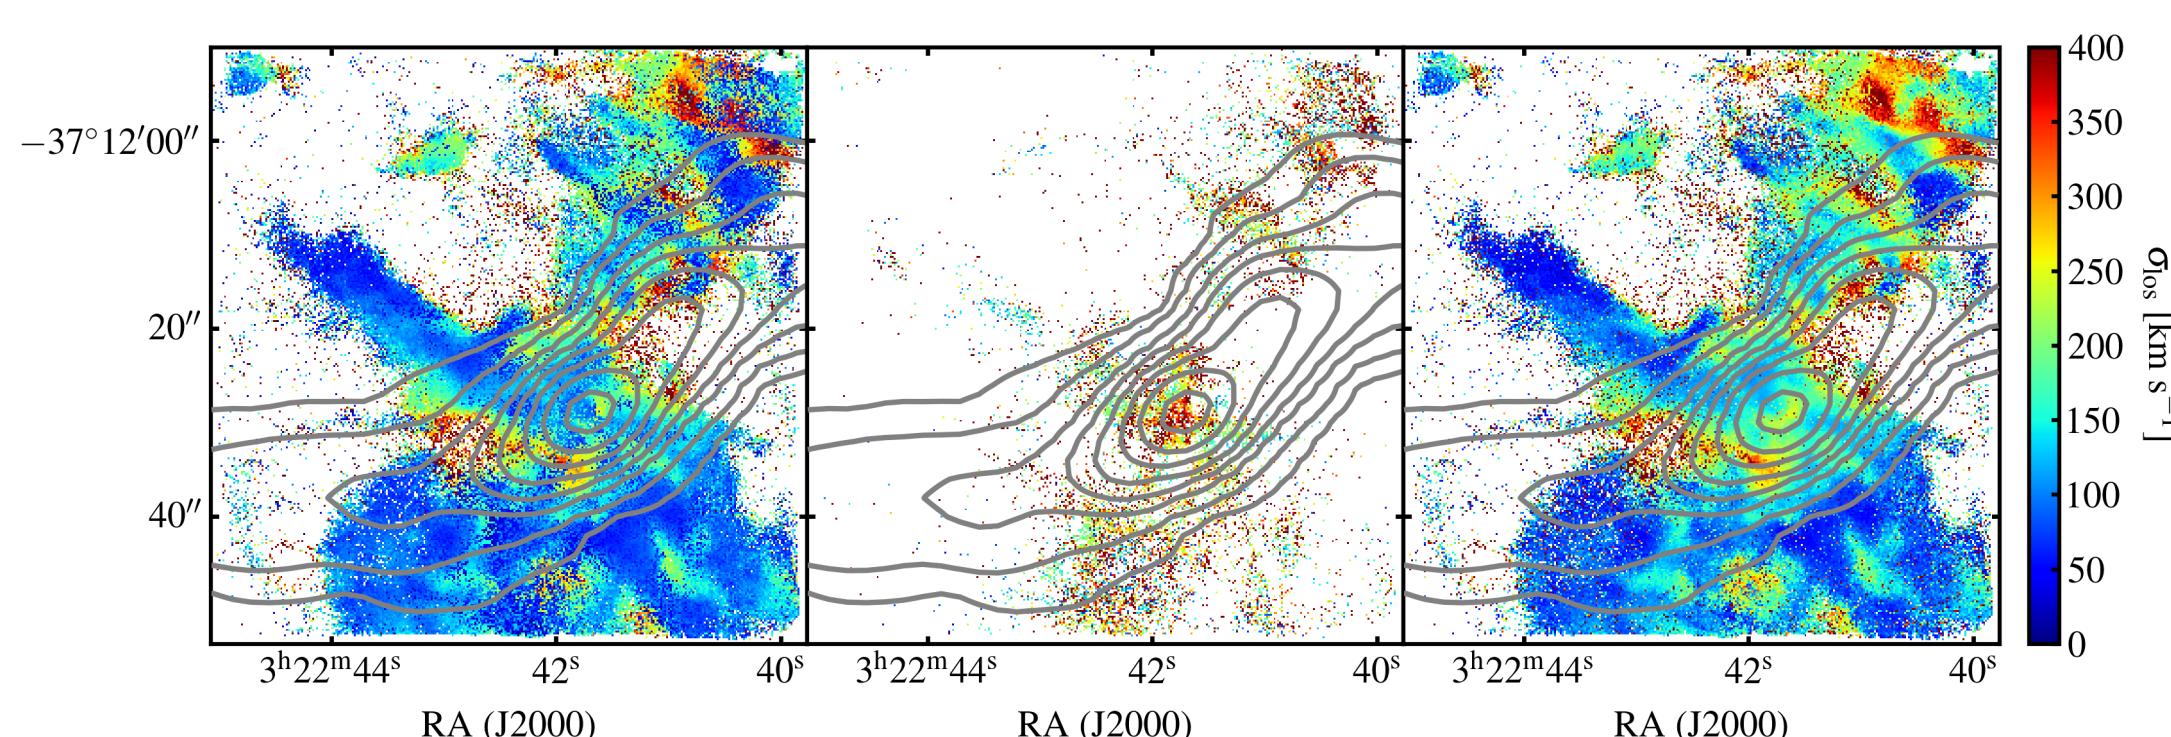

Mom 1

Mom 2

Mom 2

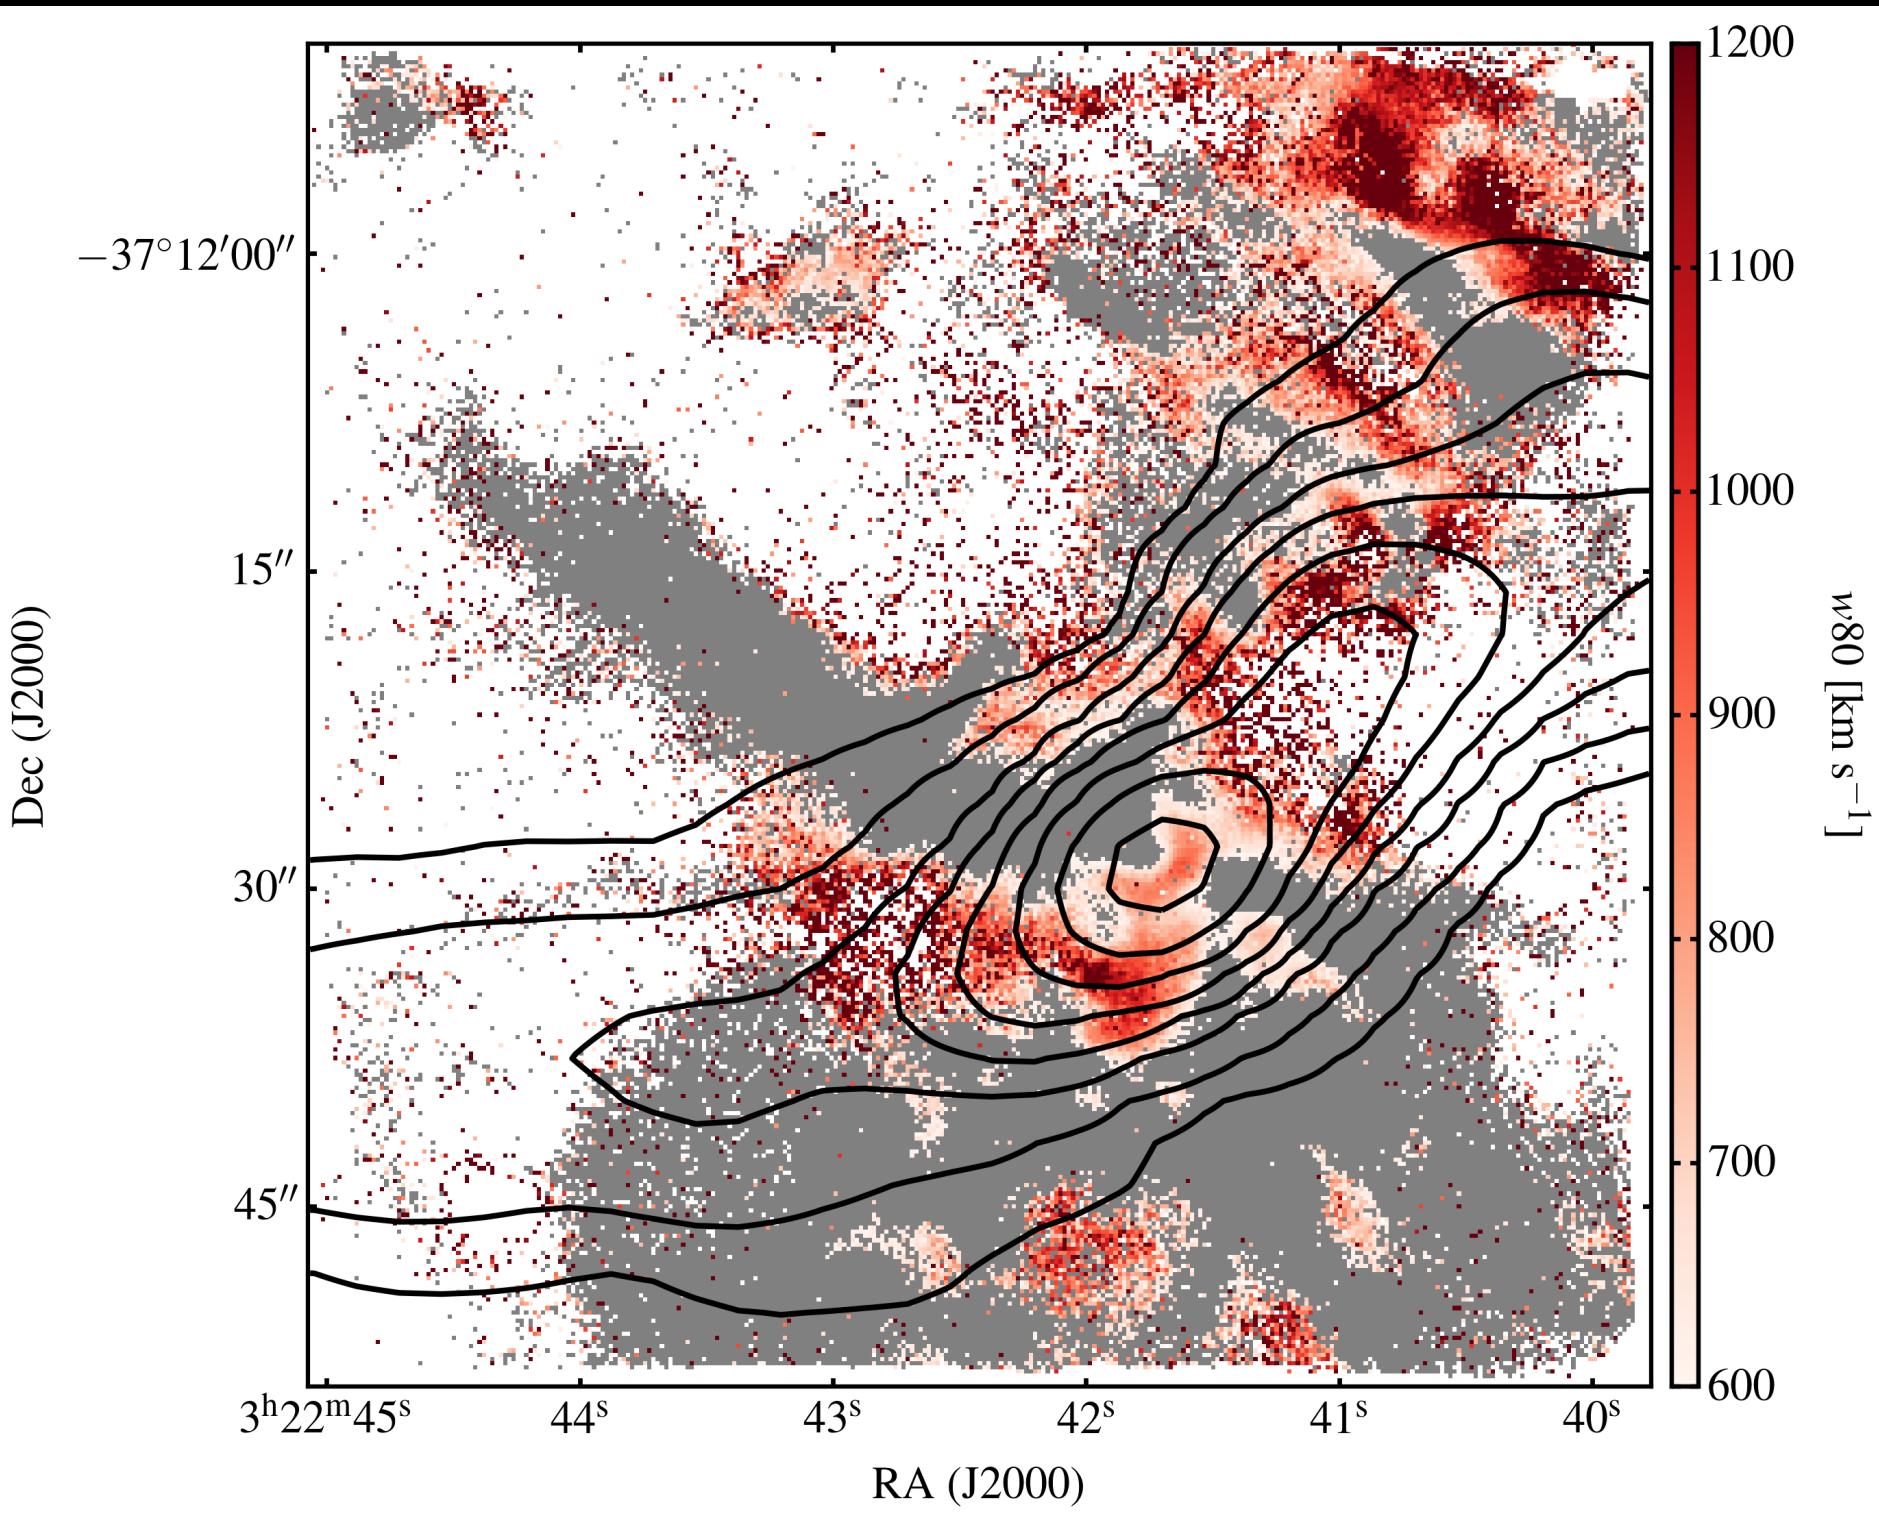

Rotation axis of the gas
(NW-SE) perpendicular
to the stellar body

Several deviations from
rotation

- EW stripe & filaments
- Clouds in the wake of
the radio jets

Fornax A - galactic multi-phase outflow

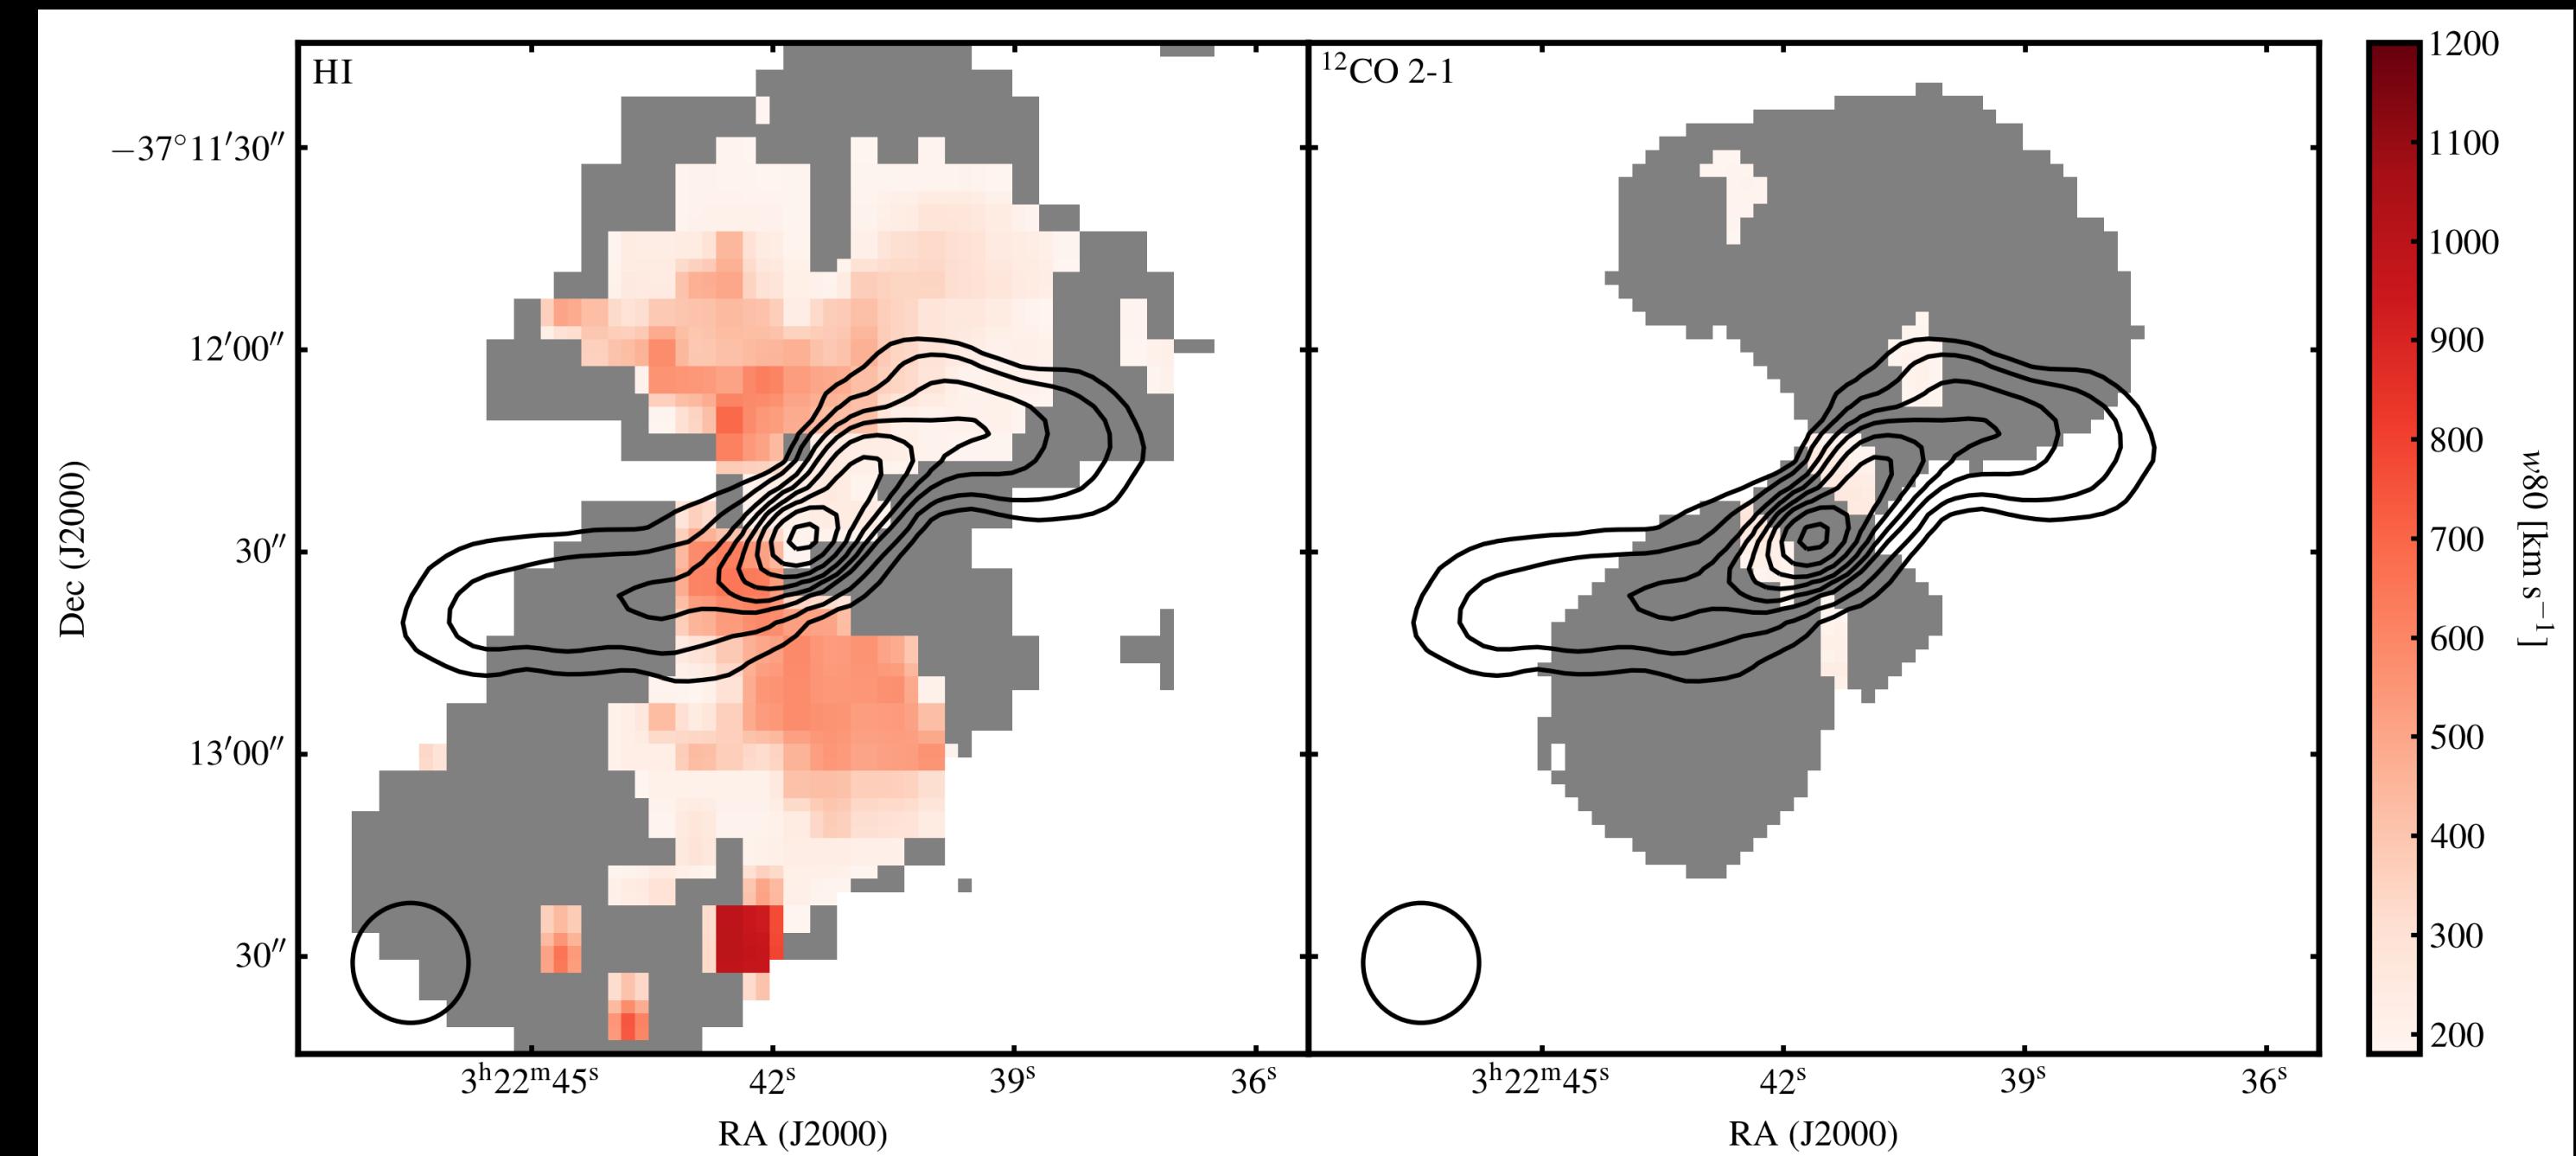

At its outflow velocity (2000 km s^{-1}) the outer ring would have reached its distance from the centre in $\sim 3 \text{ Myr}$

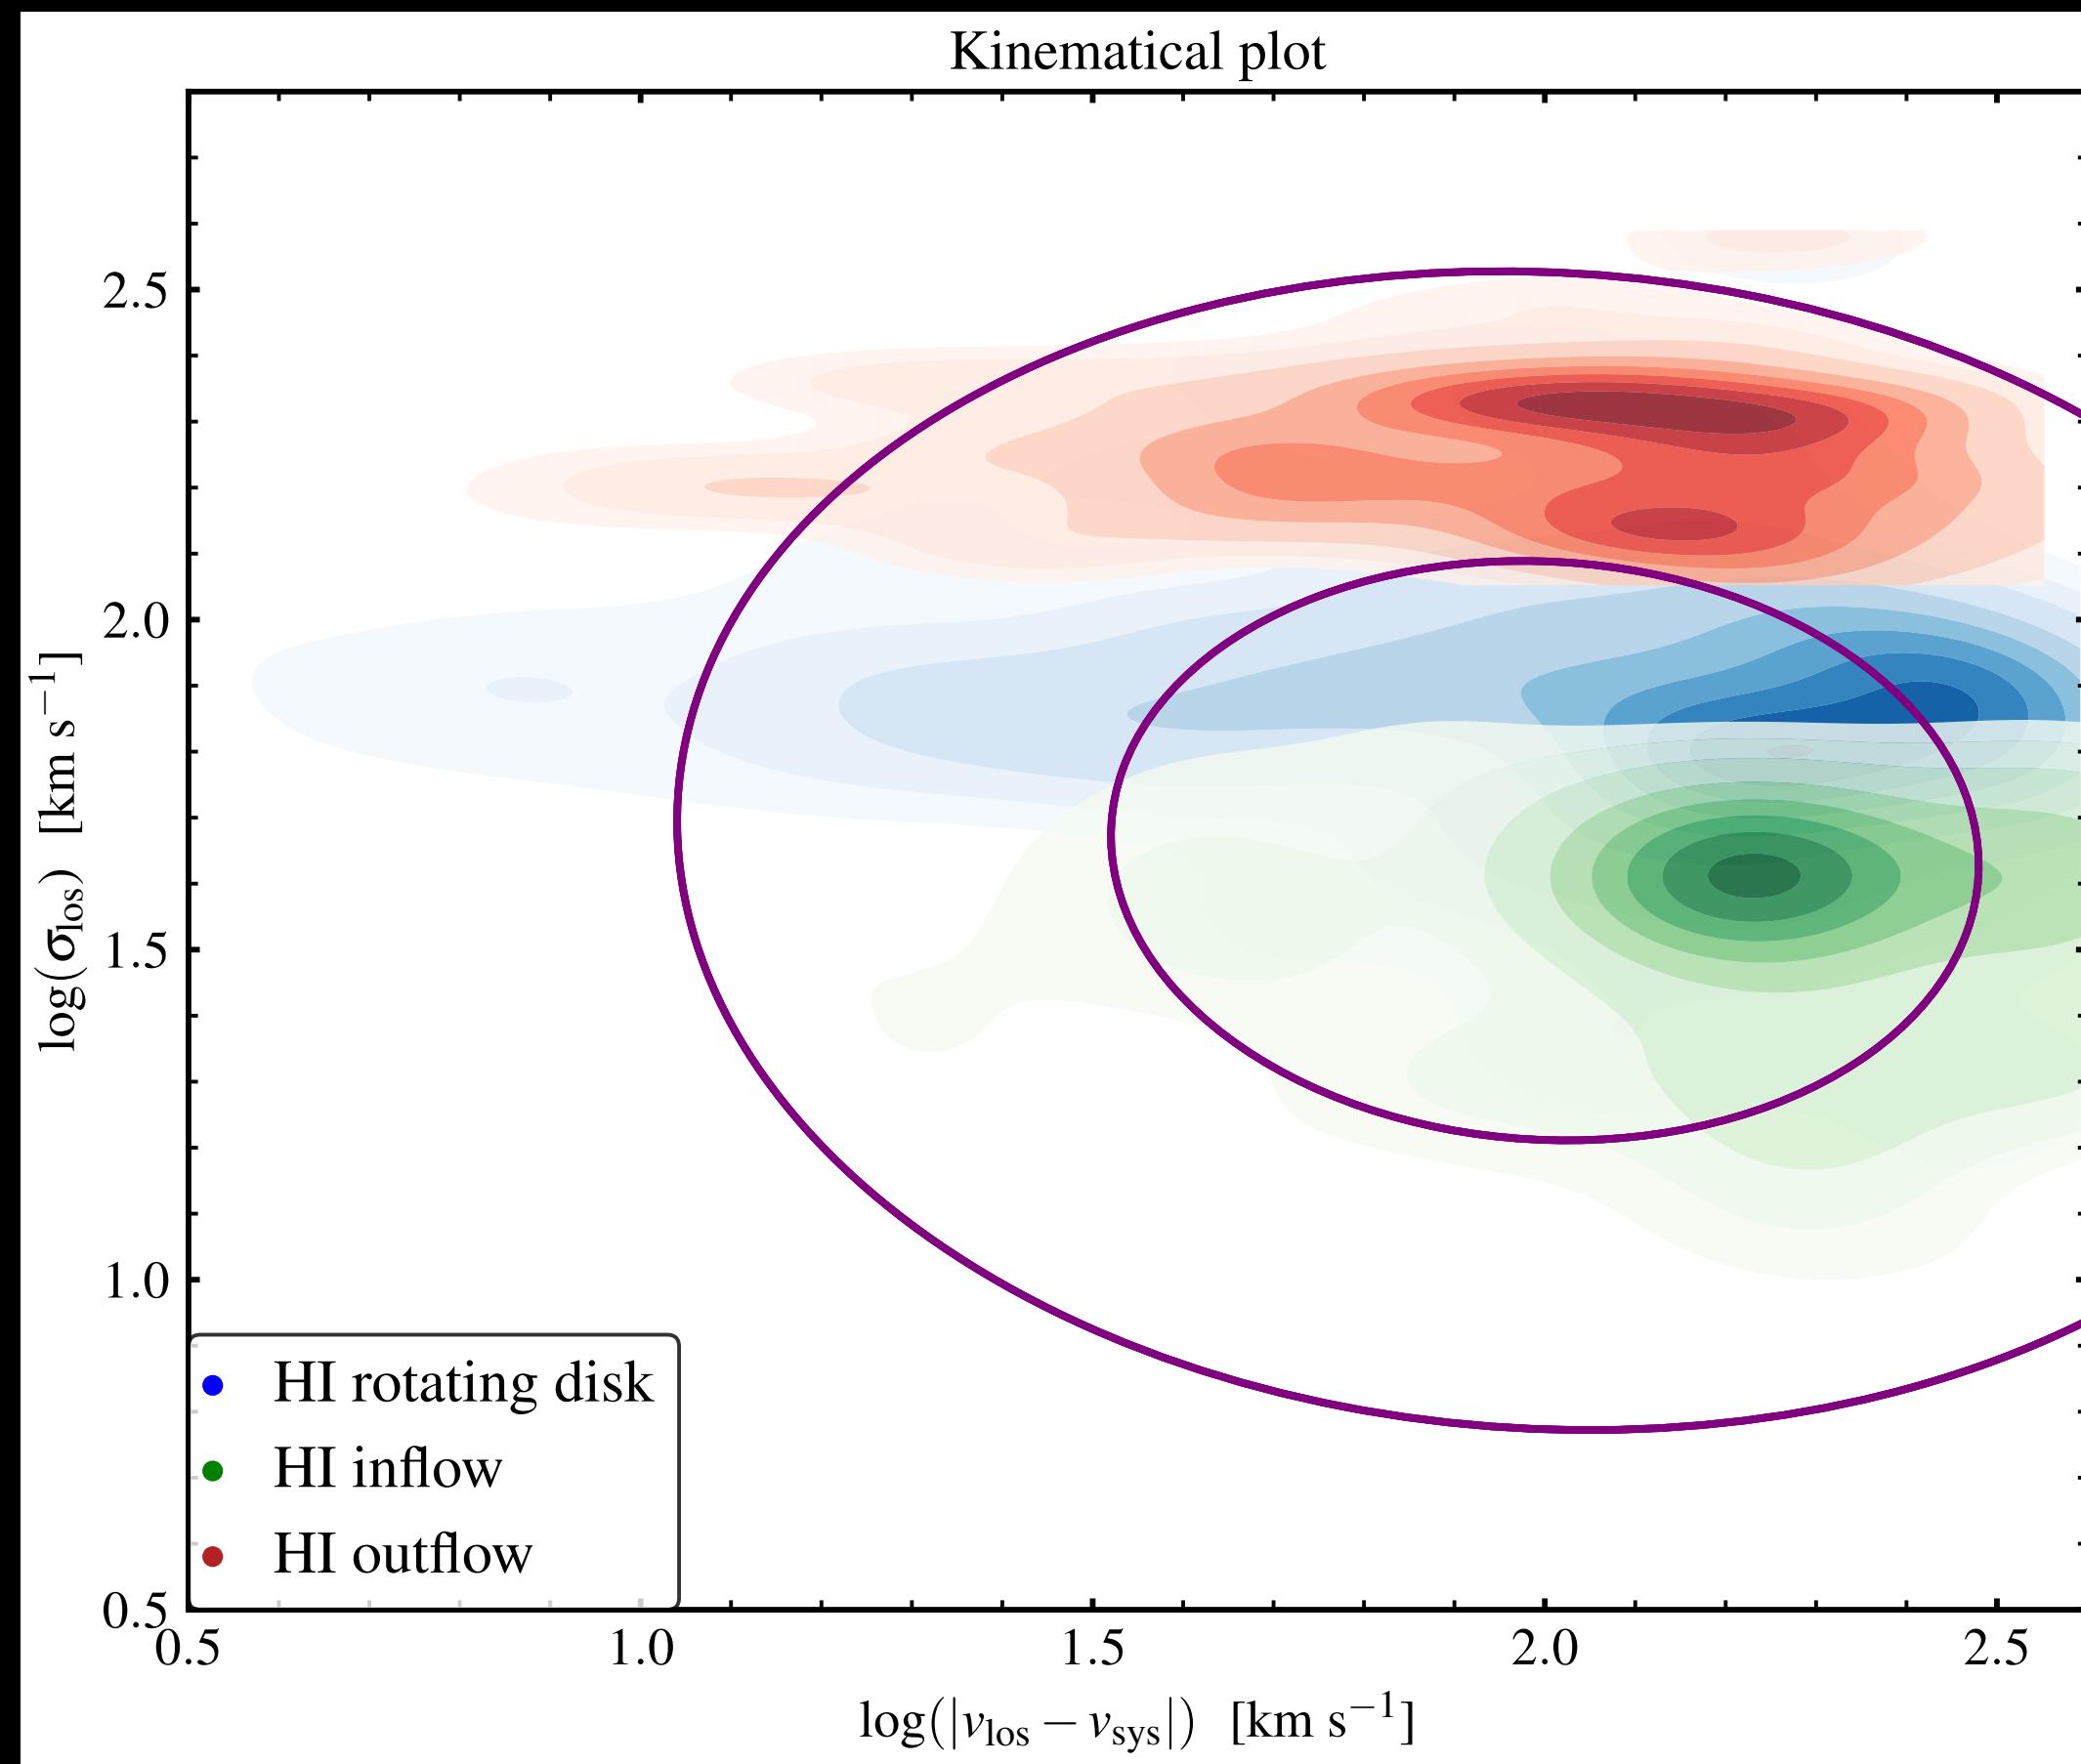

==

Age of the radio jets

- Ionised gas
 - $w80 > 600 \text{ km s}^{-1}$ in the wake of the radio jets
- Cold gas
 - $w80 > 600 \text{ km s}^{-1}$ along the jets and in the outer ring

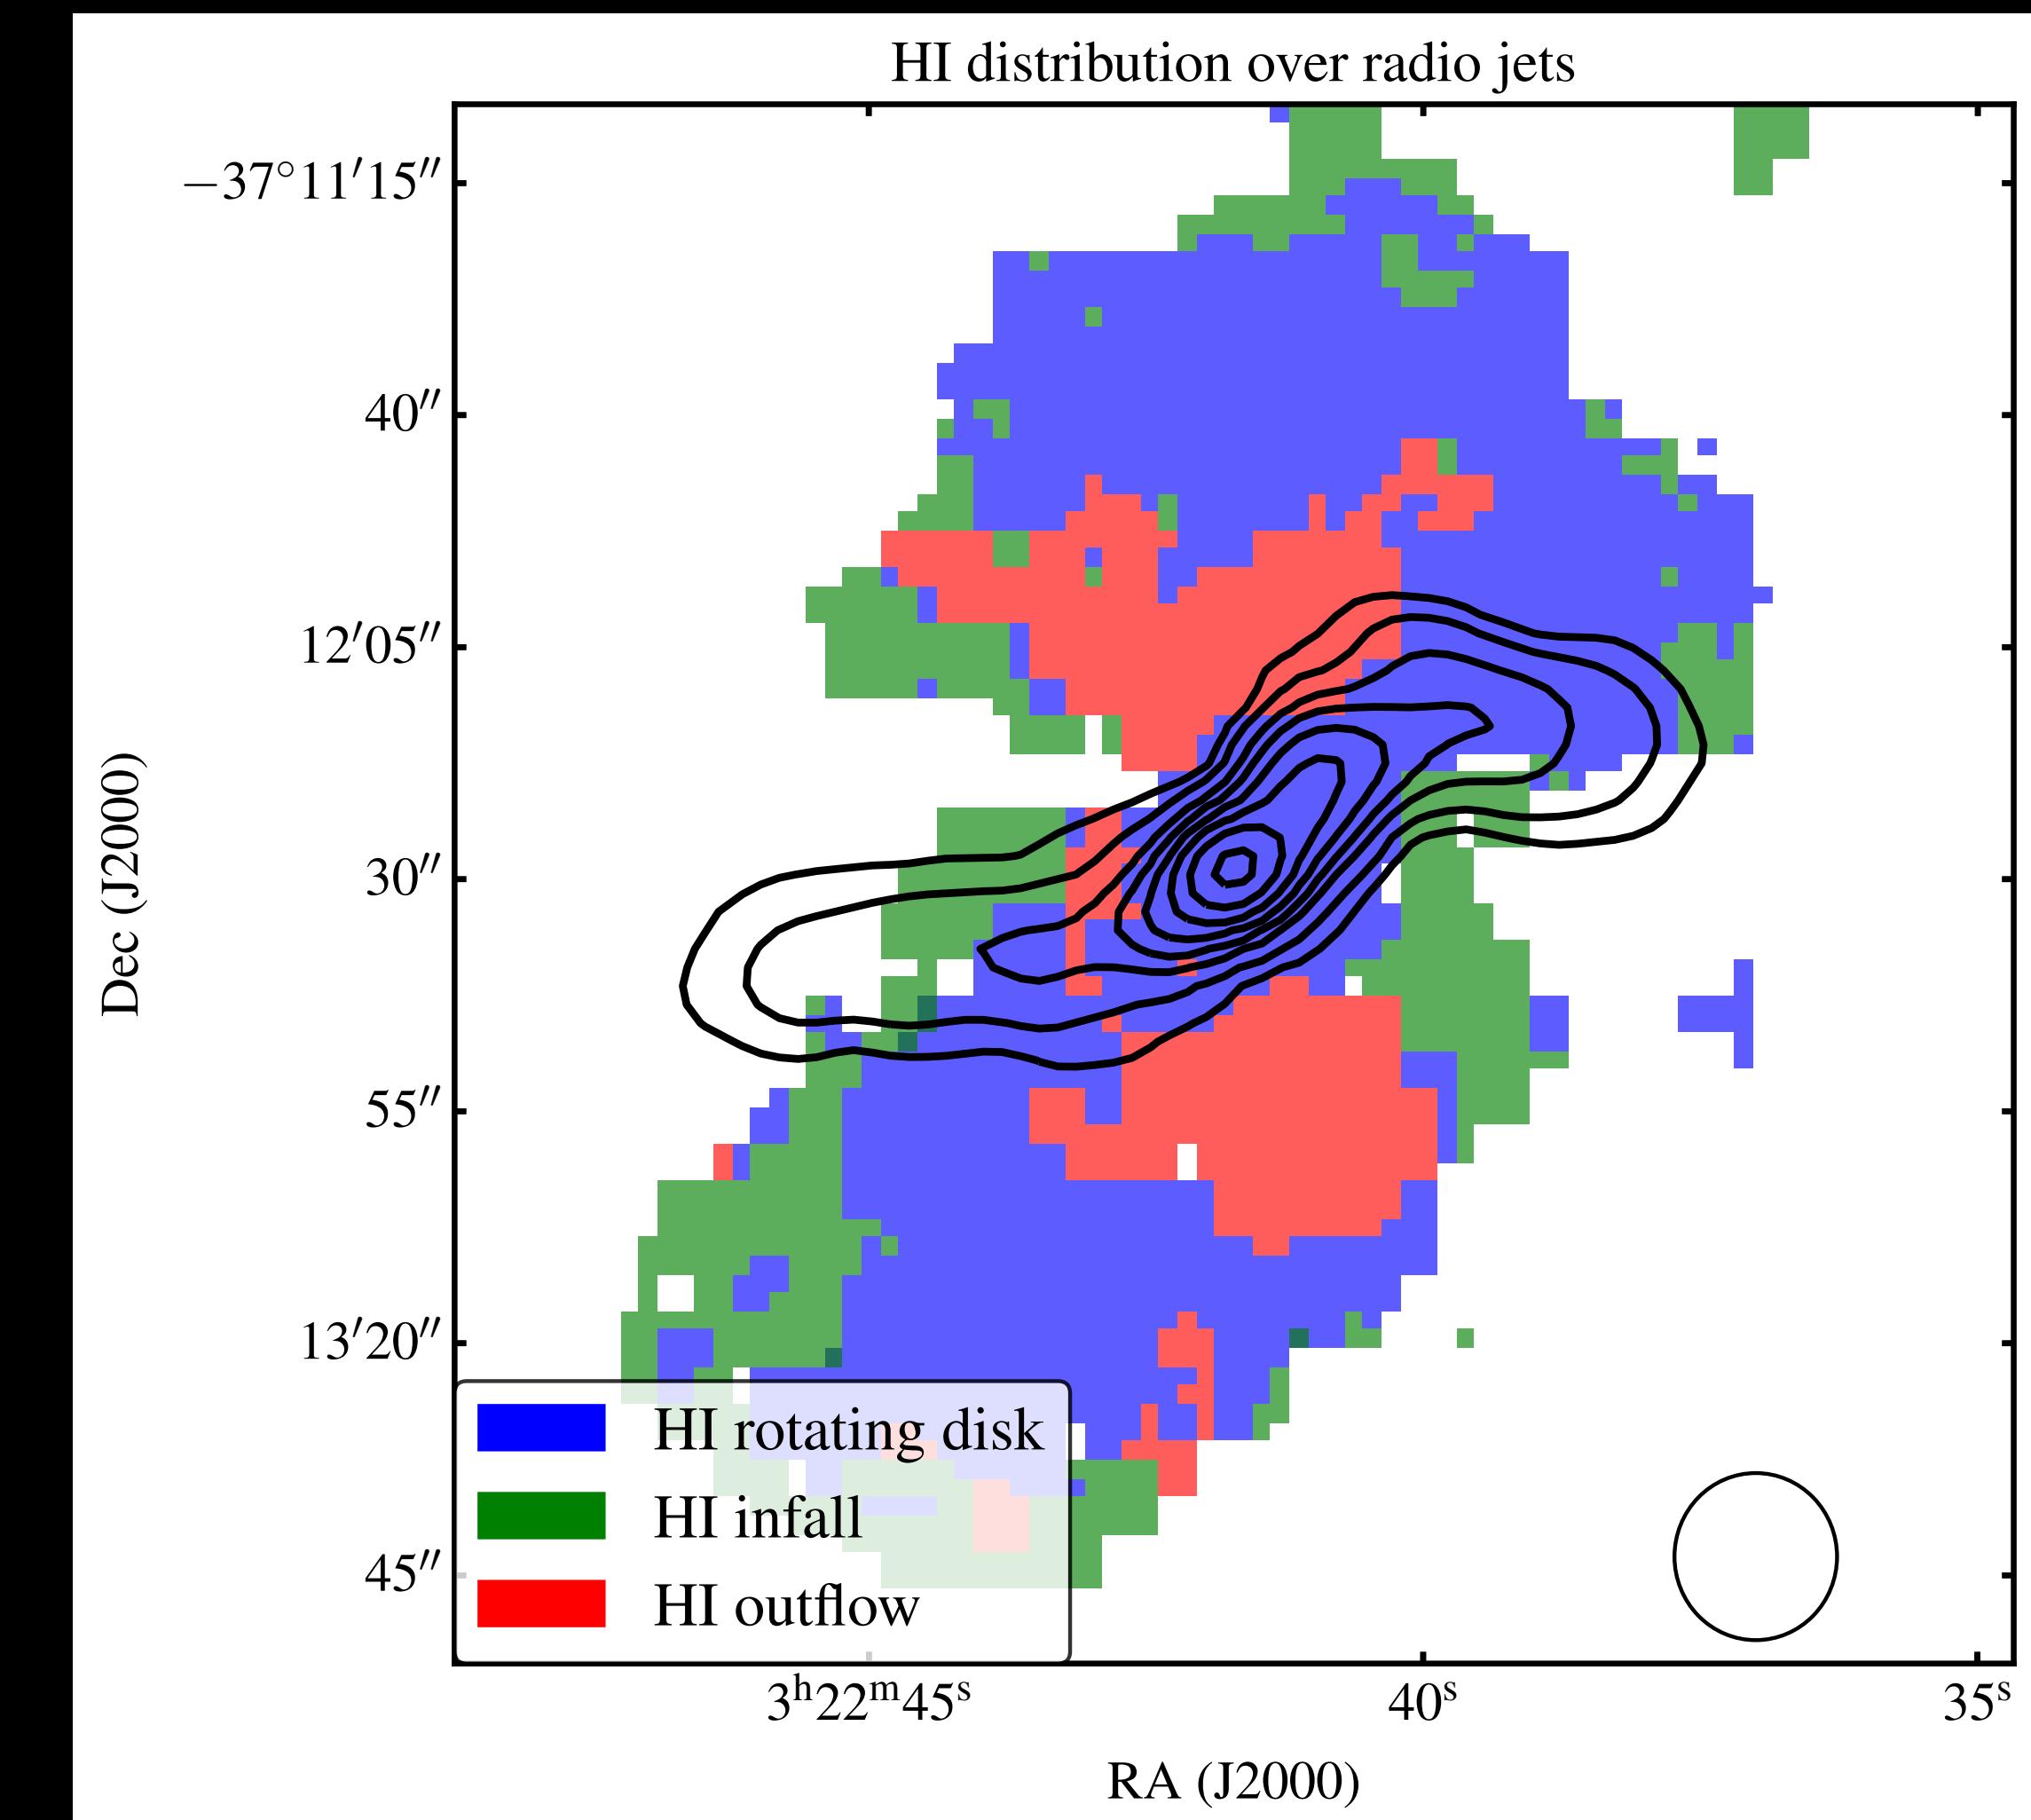

Fornax A - regions with similar kinematics

Kinematical plot (k-plot)

naturally identifies loci with similar kinematics

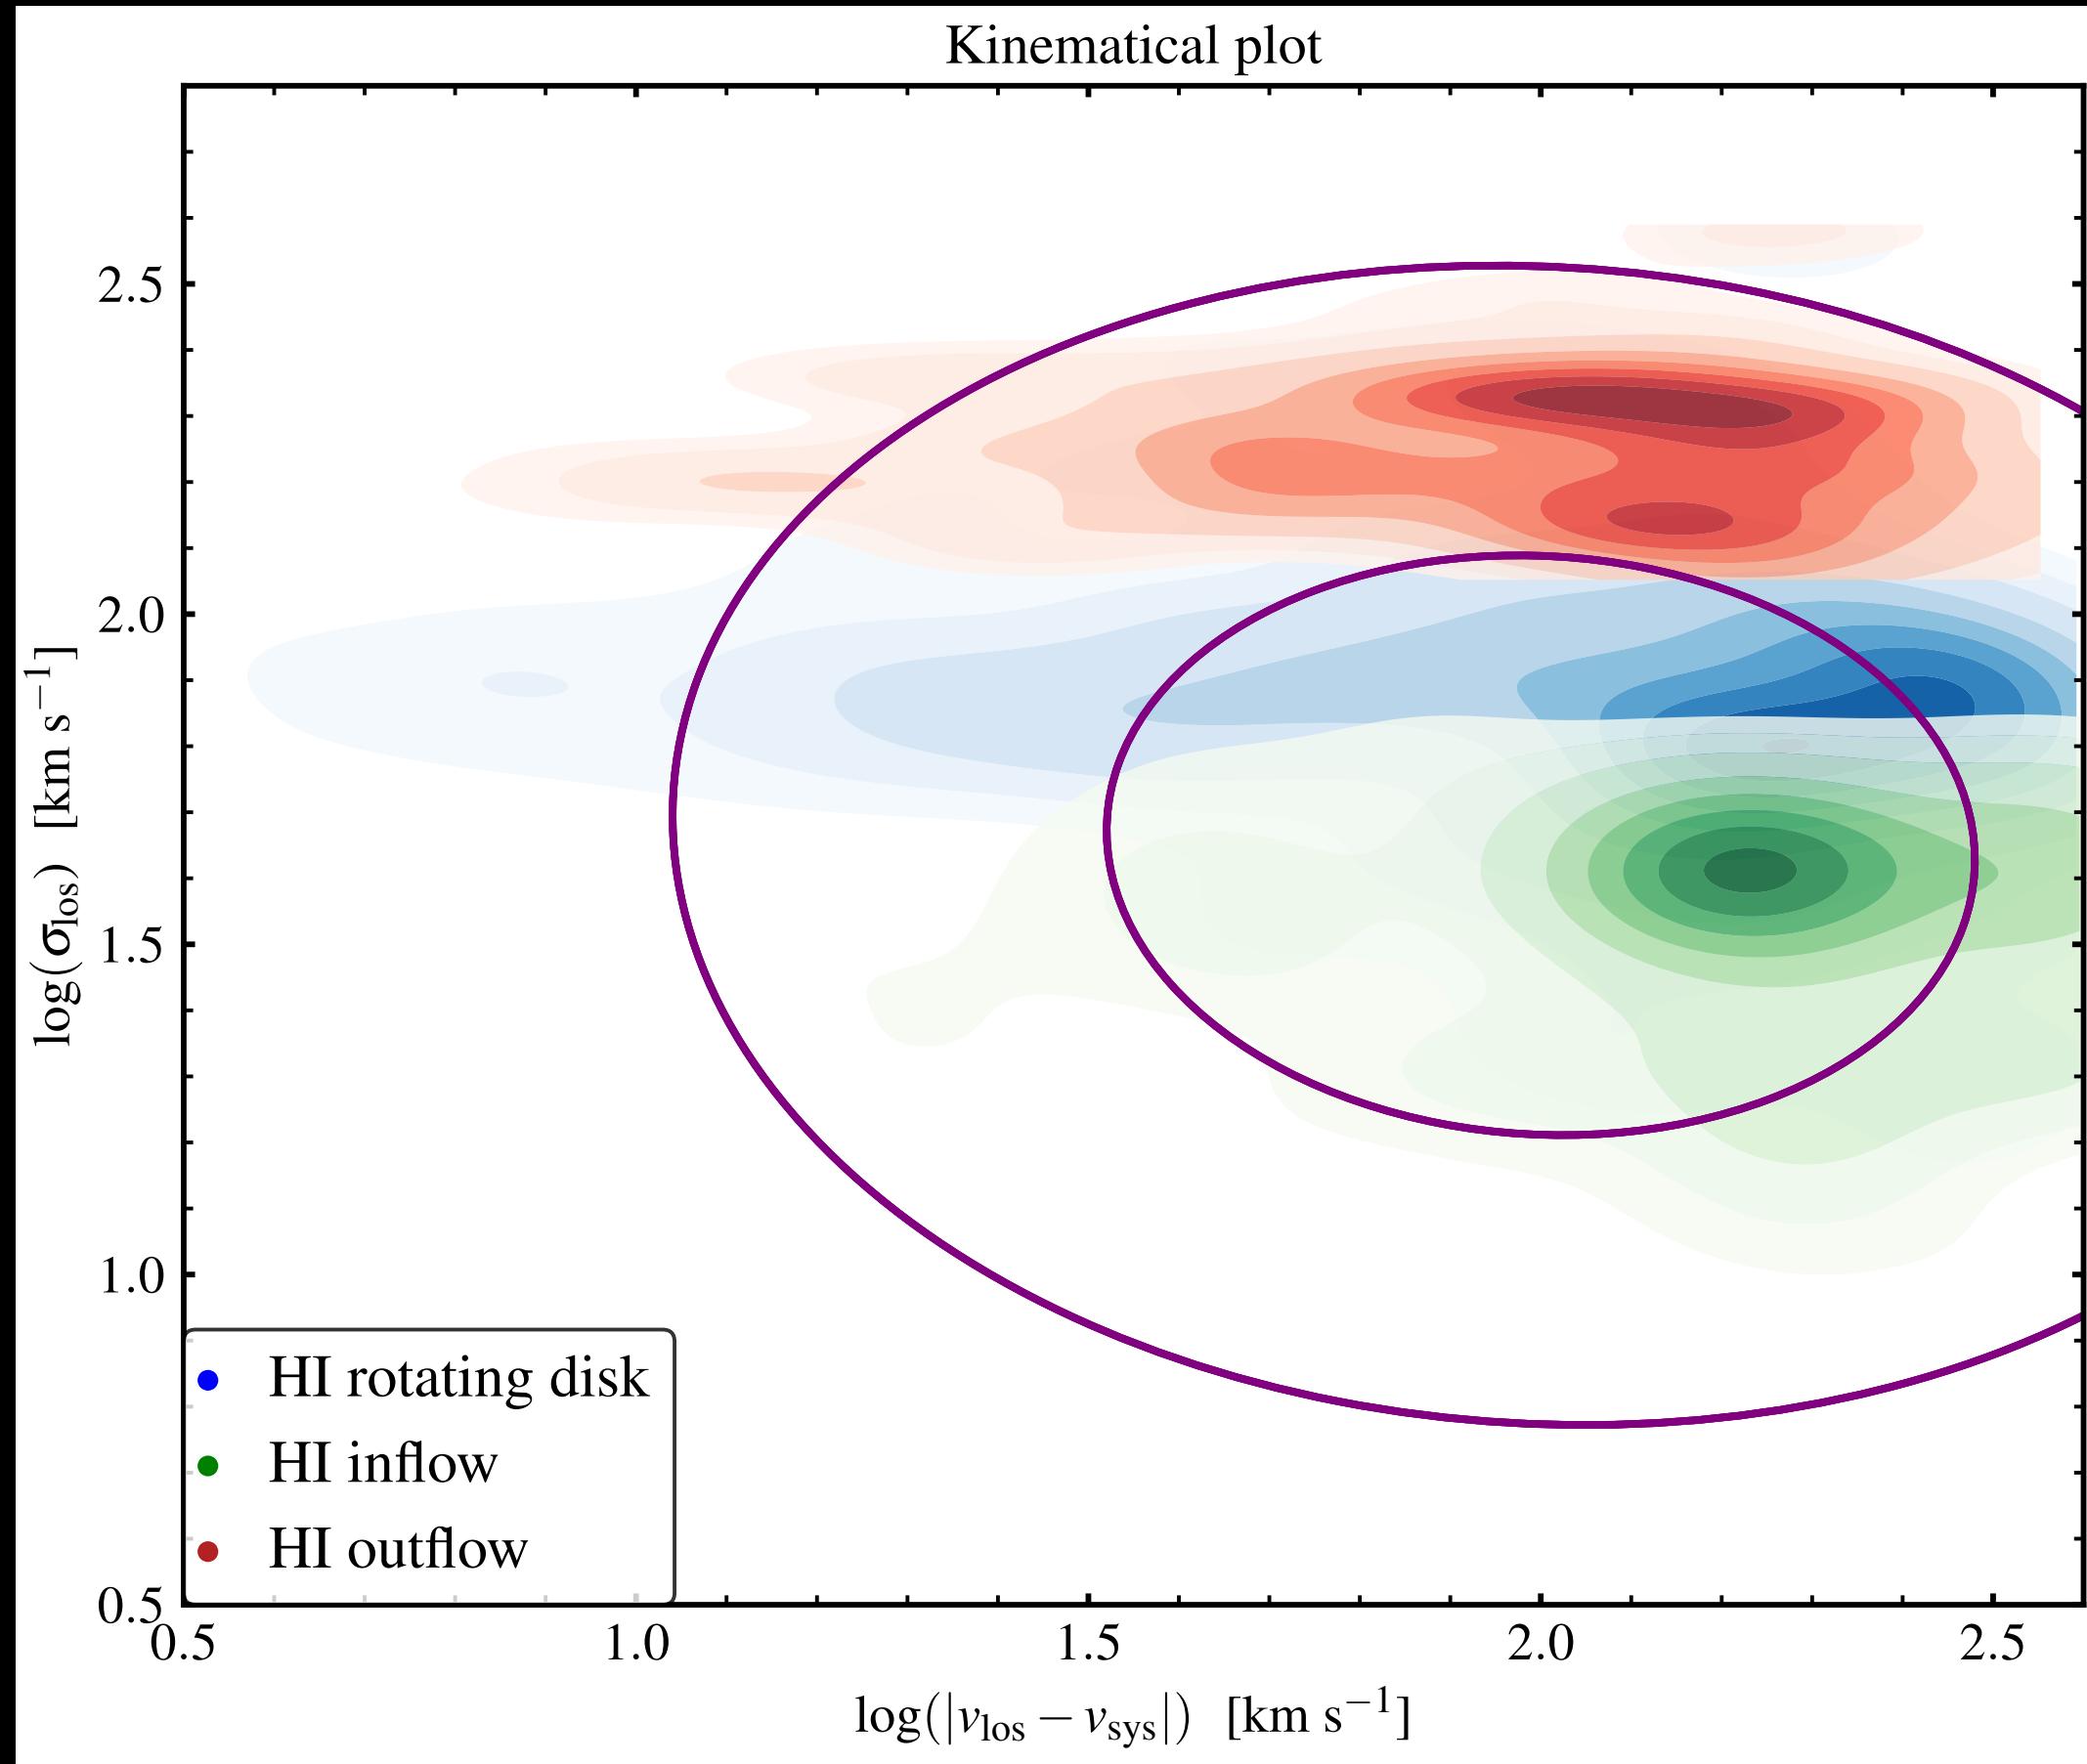

broad line-widths (R6) -> outflow in the wake of the radio jet

narrow line-widths -> EW stripe and filament and stripes

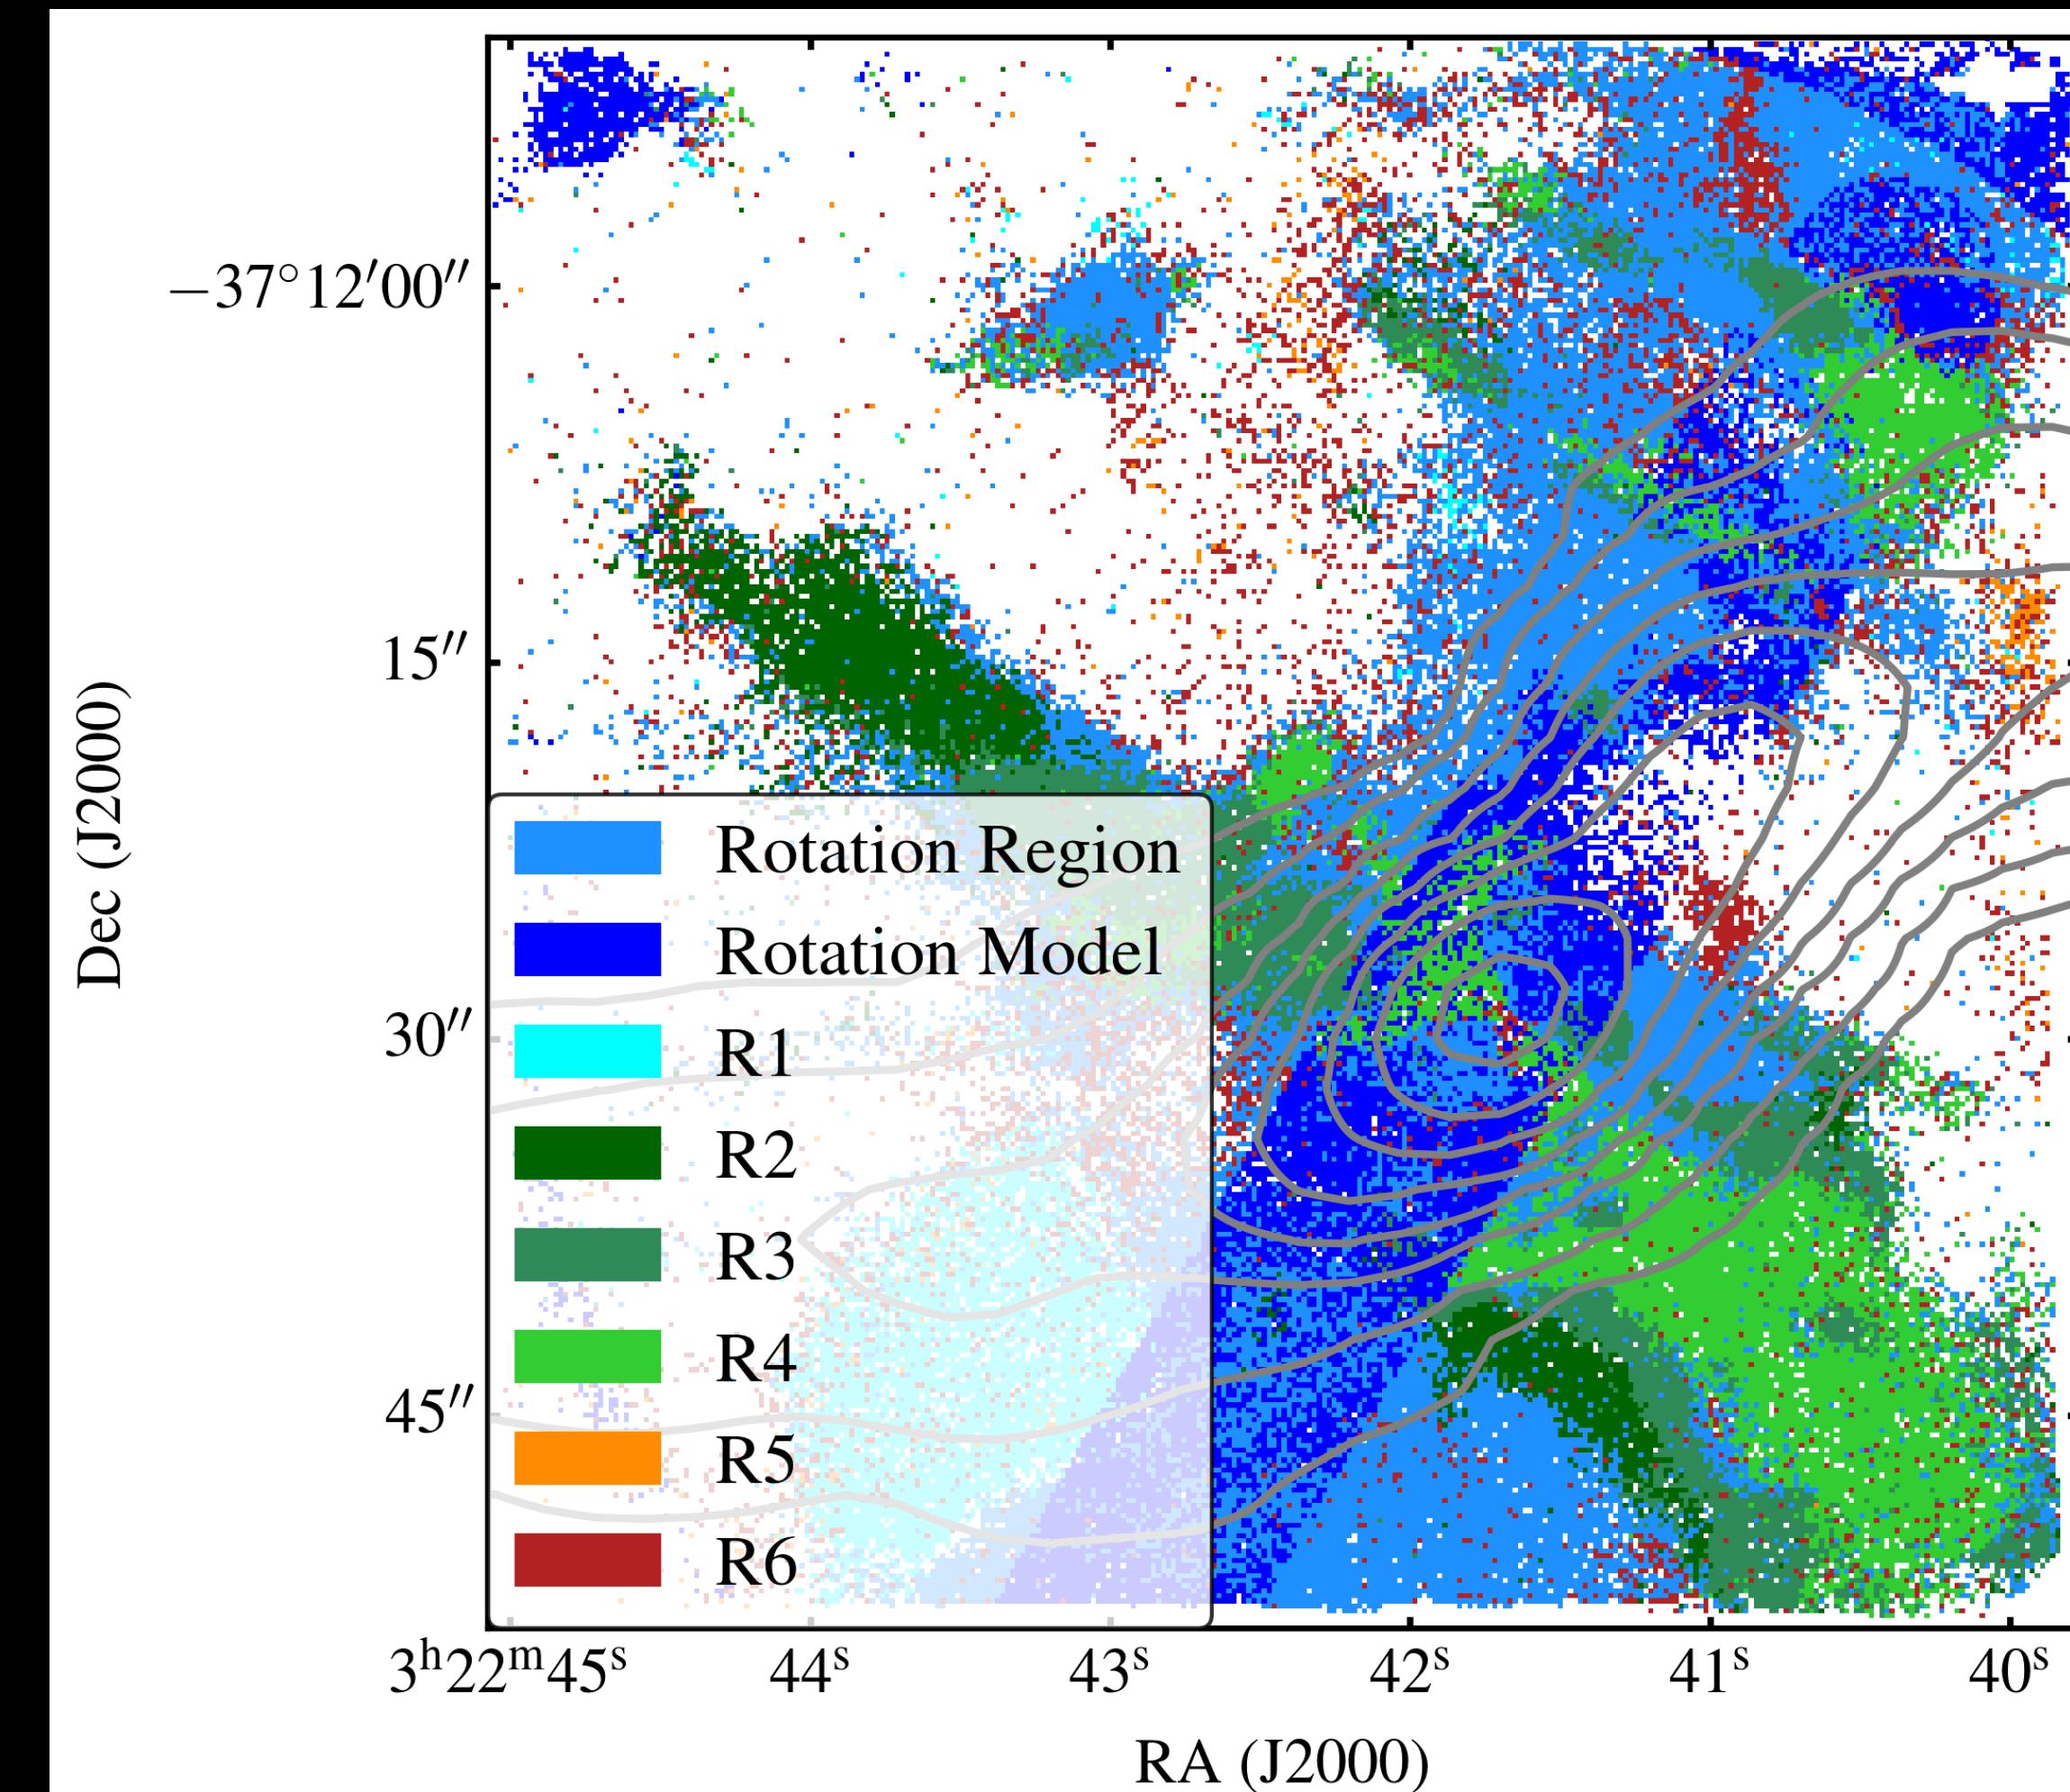

k-plot of ionised gas and CO show the same properties

Fornax A - regions with similar kinematics

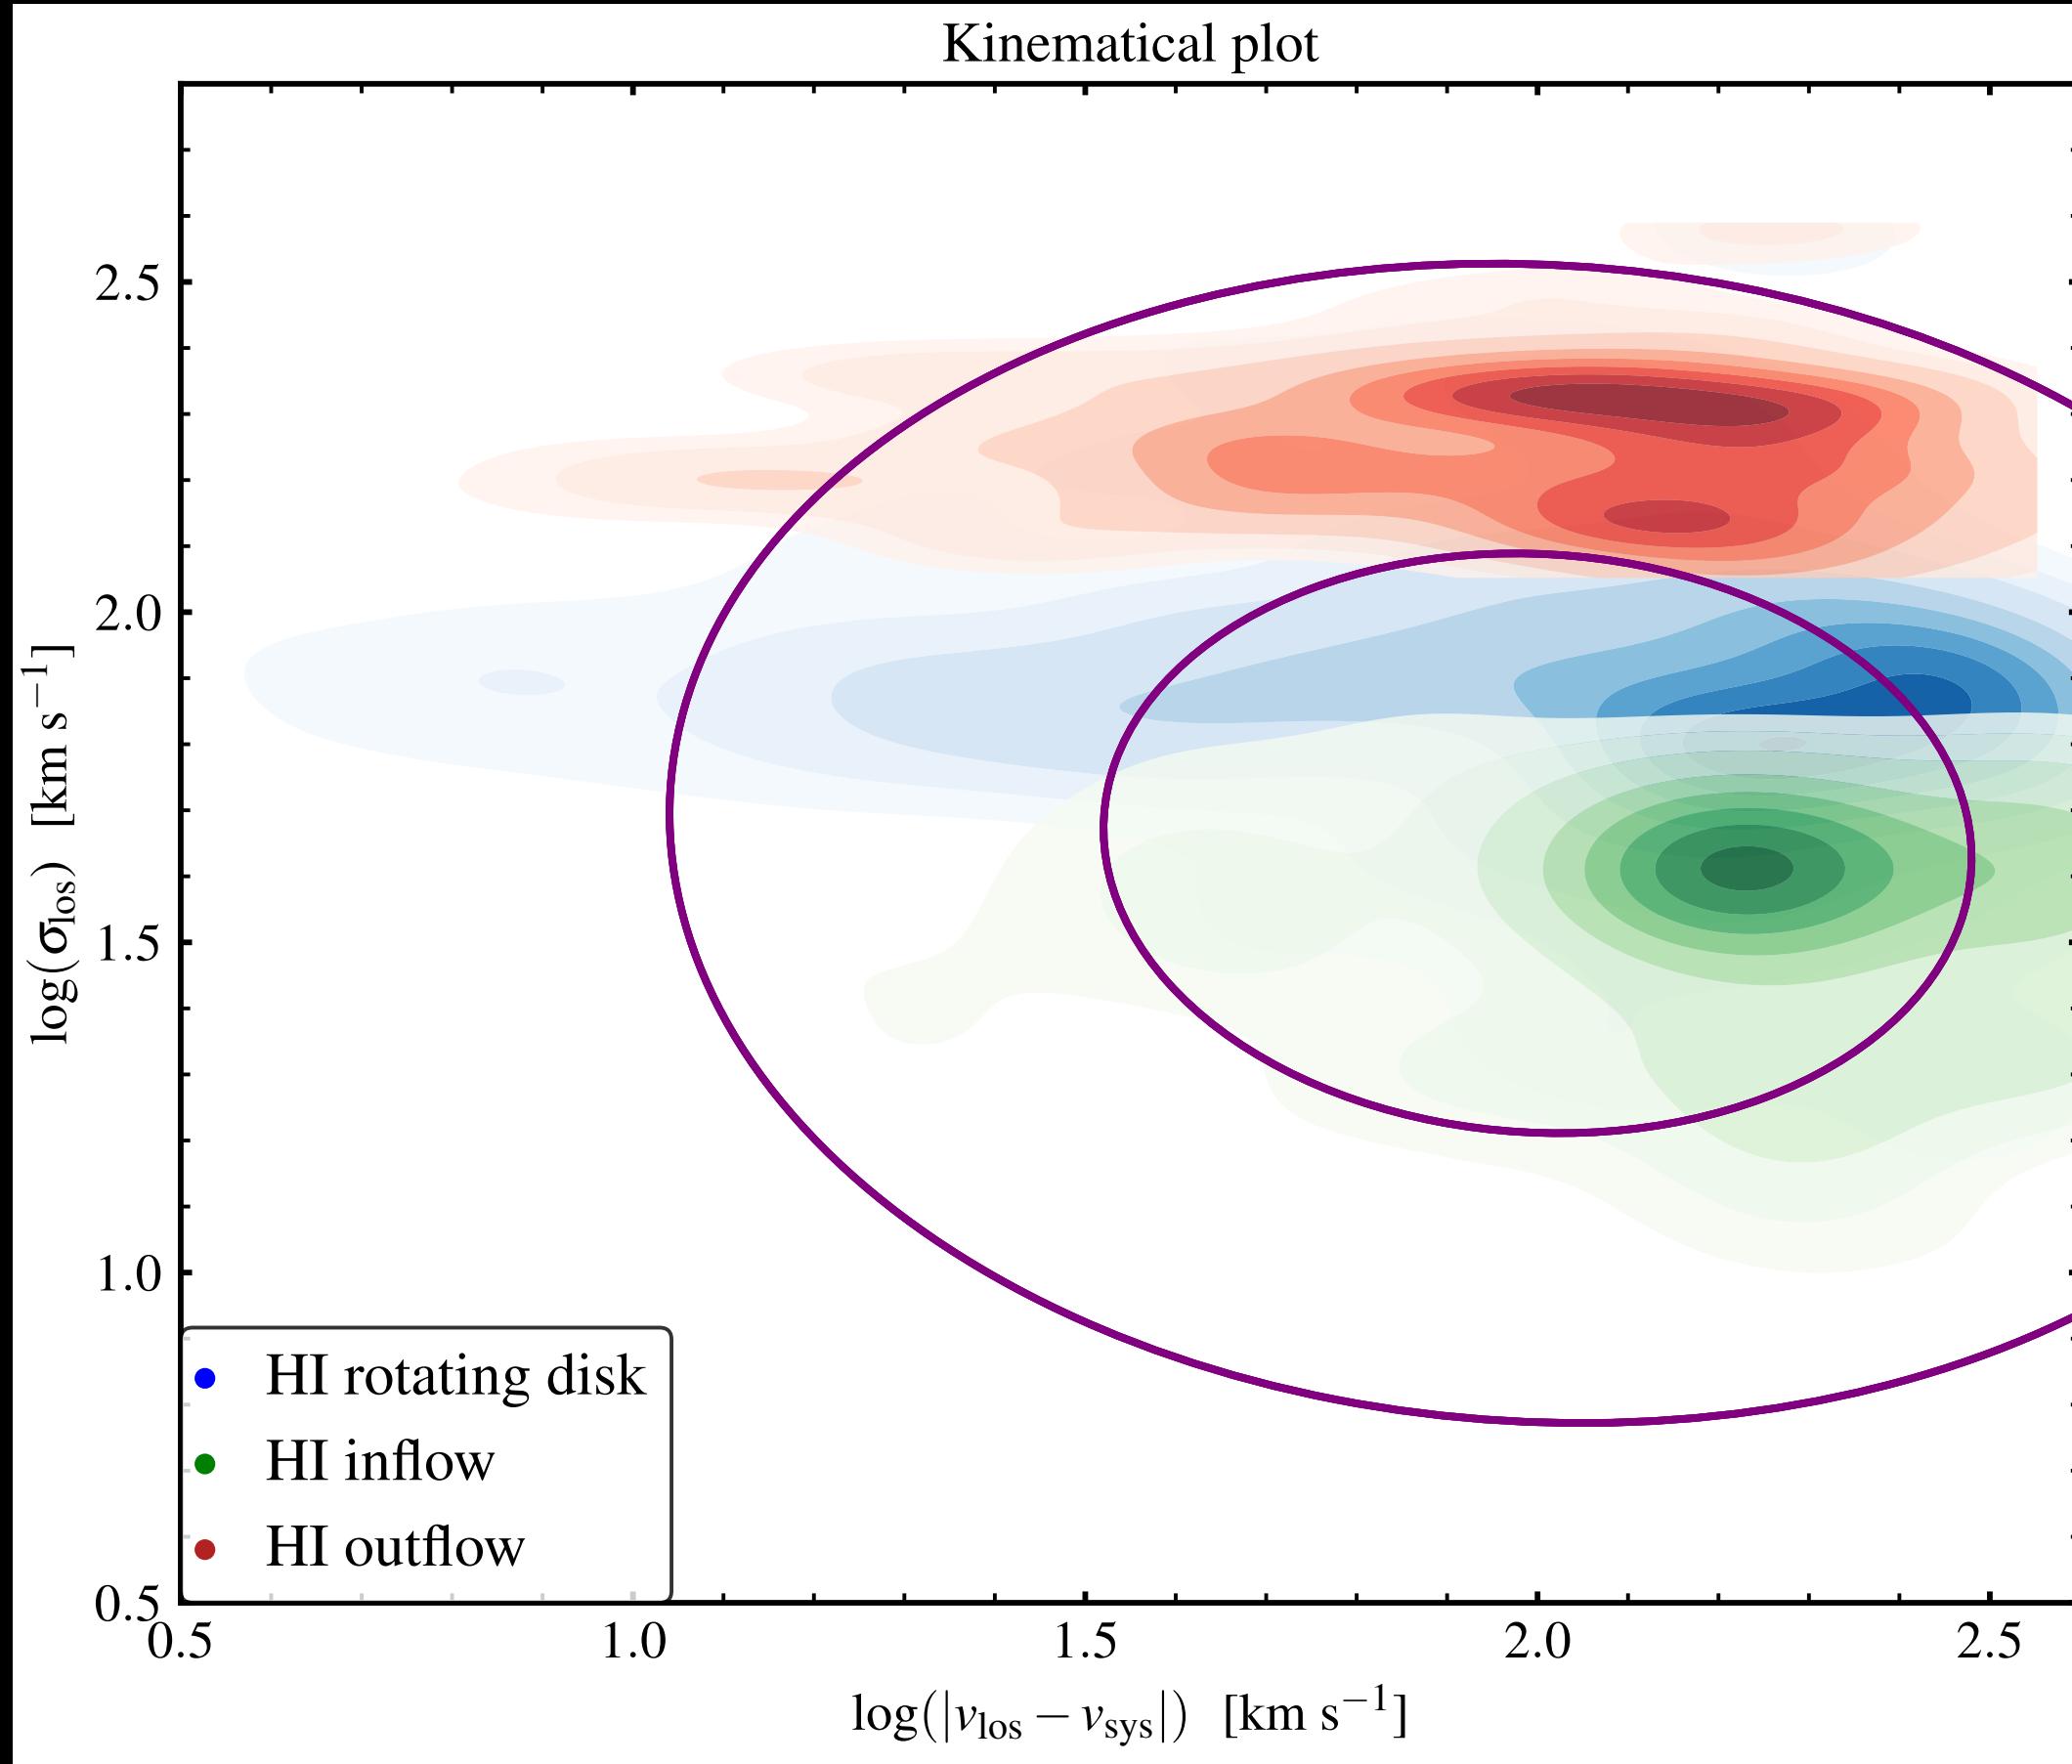

broad line-widths (R6) -> outflow in the wake of the radio jet
narrow line-widths -> EW stripe and filament and stripes
k-plot of ionised gas and CO show the same properties

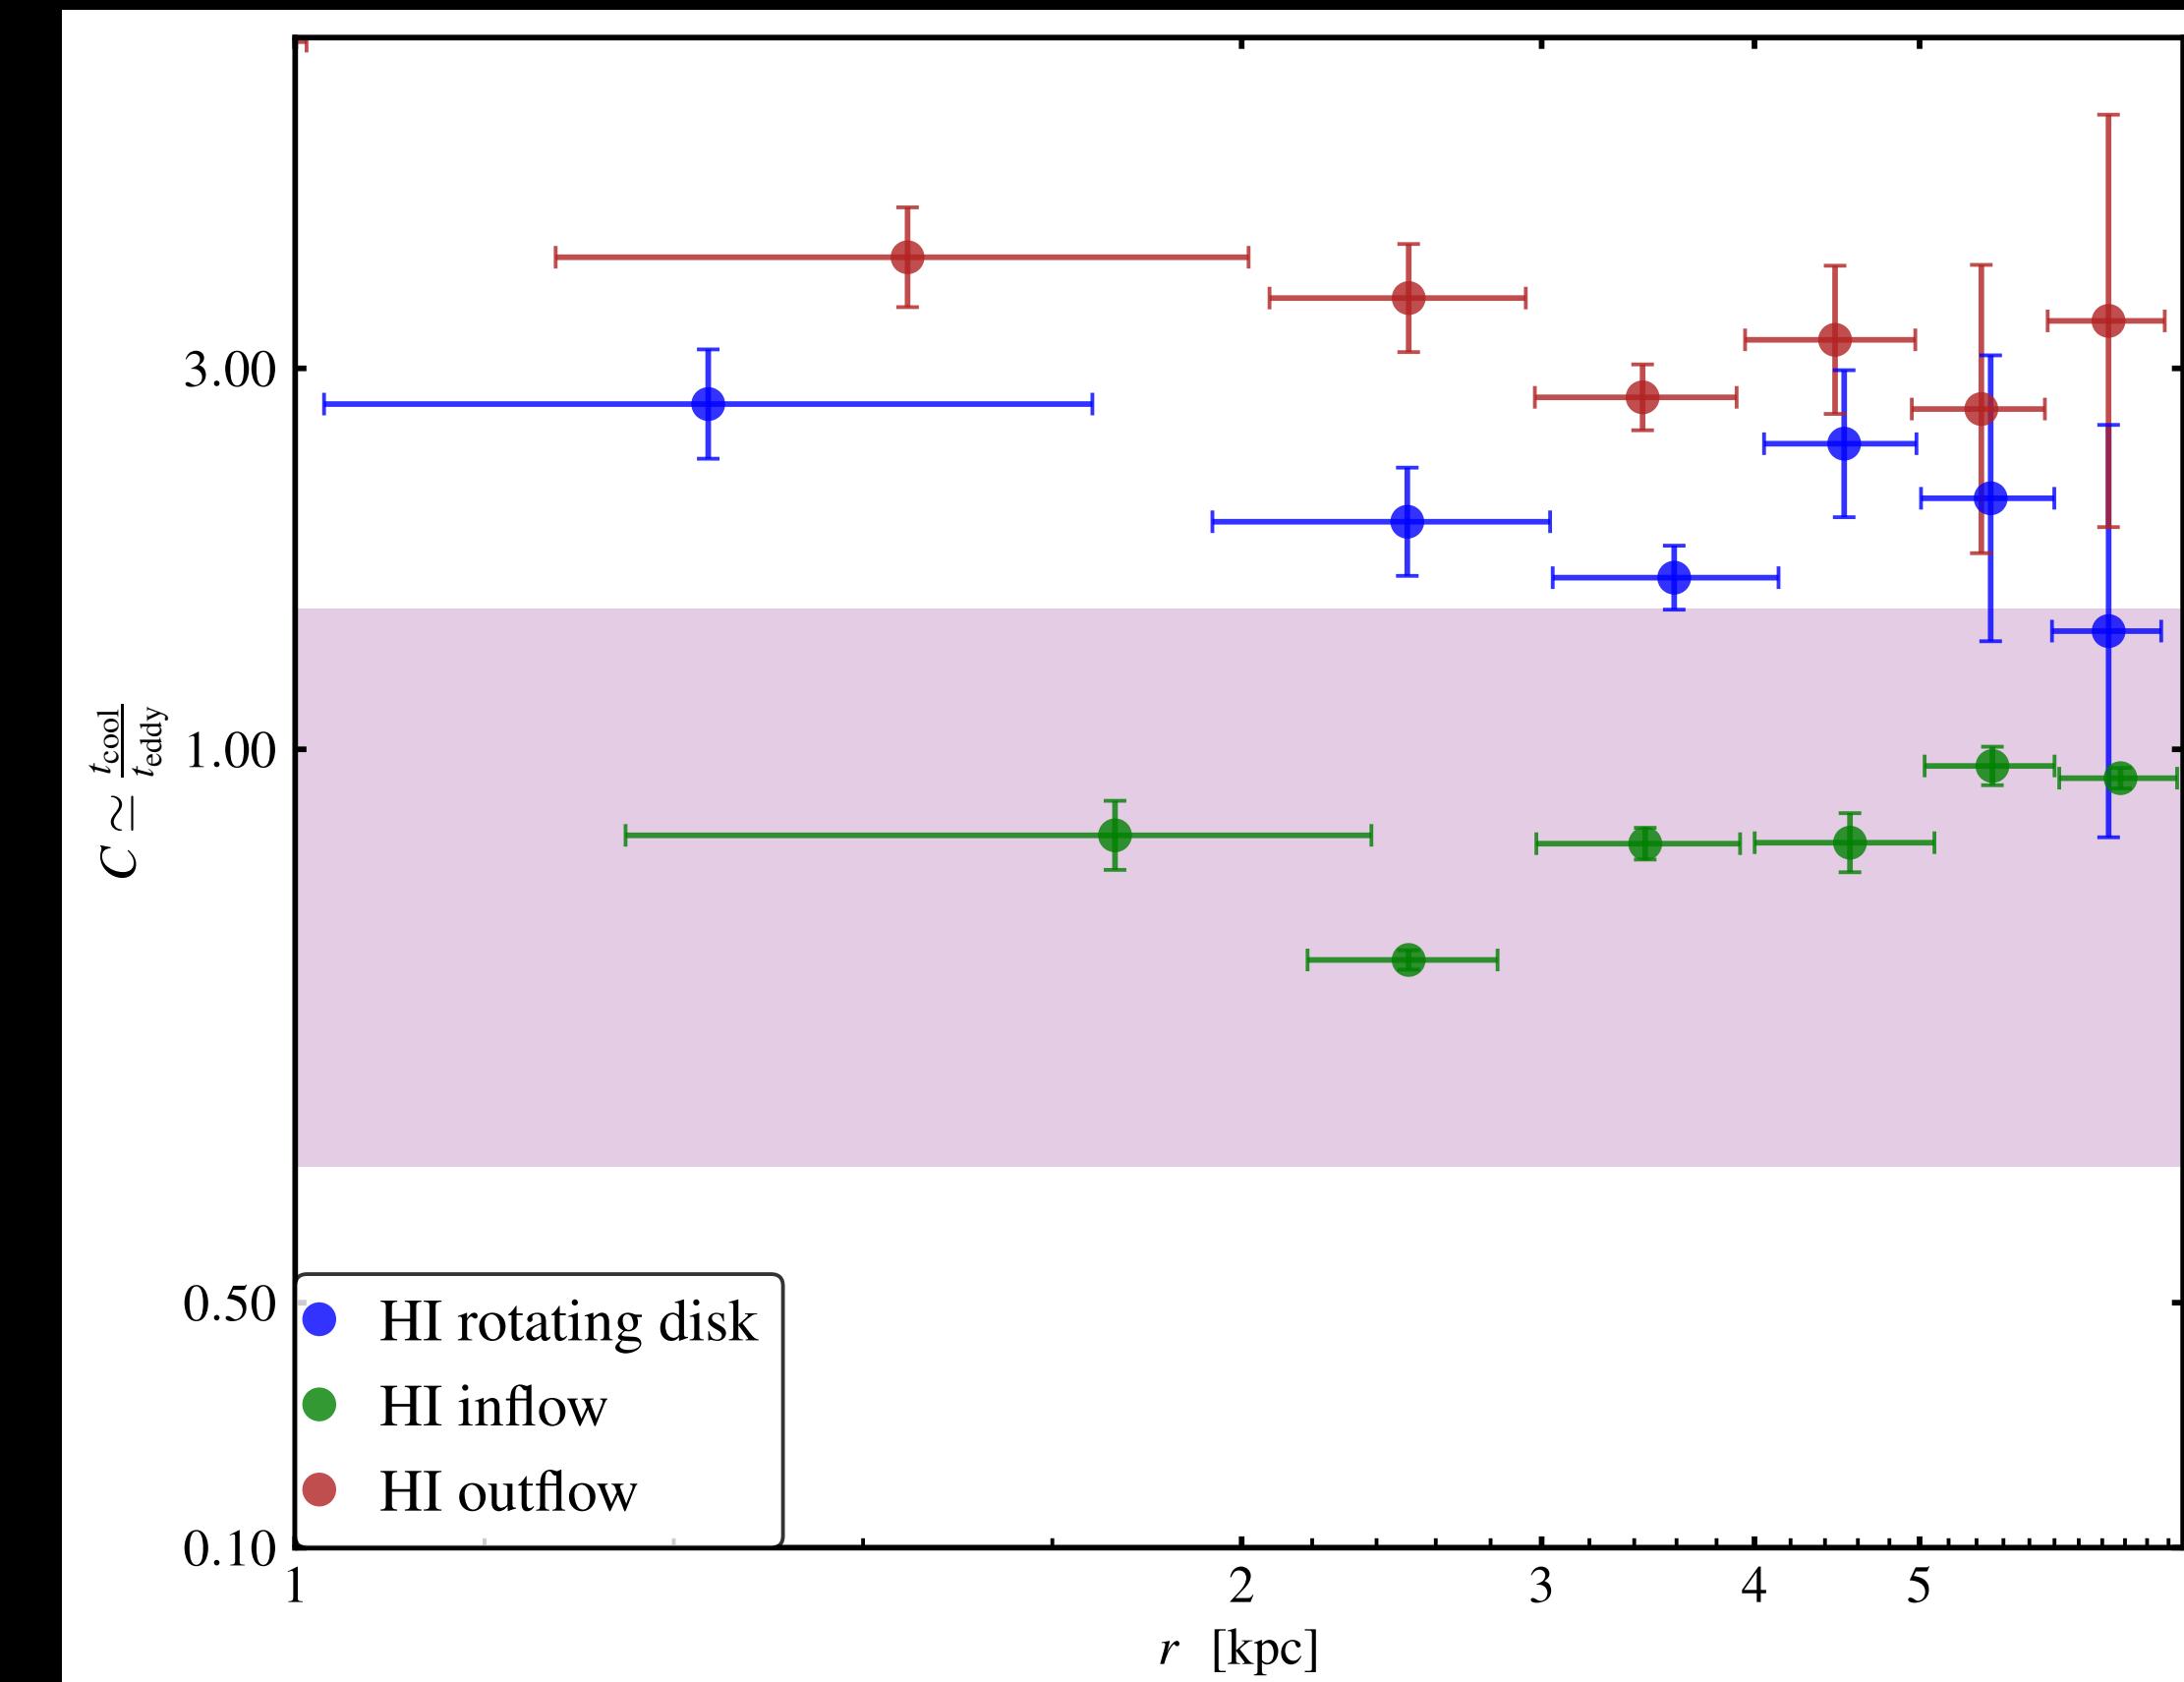

Kinematical plot (k-plot)
naturally identifies loci with similar kinematics

Fornax A - cold gas AGN feeding

- Purple ellipsis
 - expectations of **Cold Chaotic Accretion** simulations (Gaspari+13,18...) for infalling material
- The EW stripe and filaments may be feeding the AGN

C-Ratio — cooling time / eddy turnover time

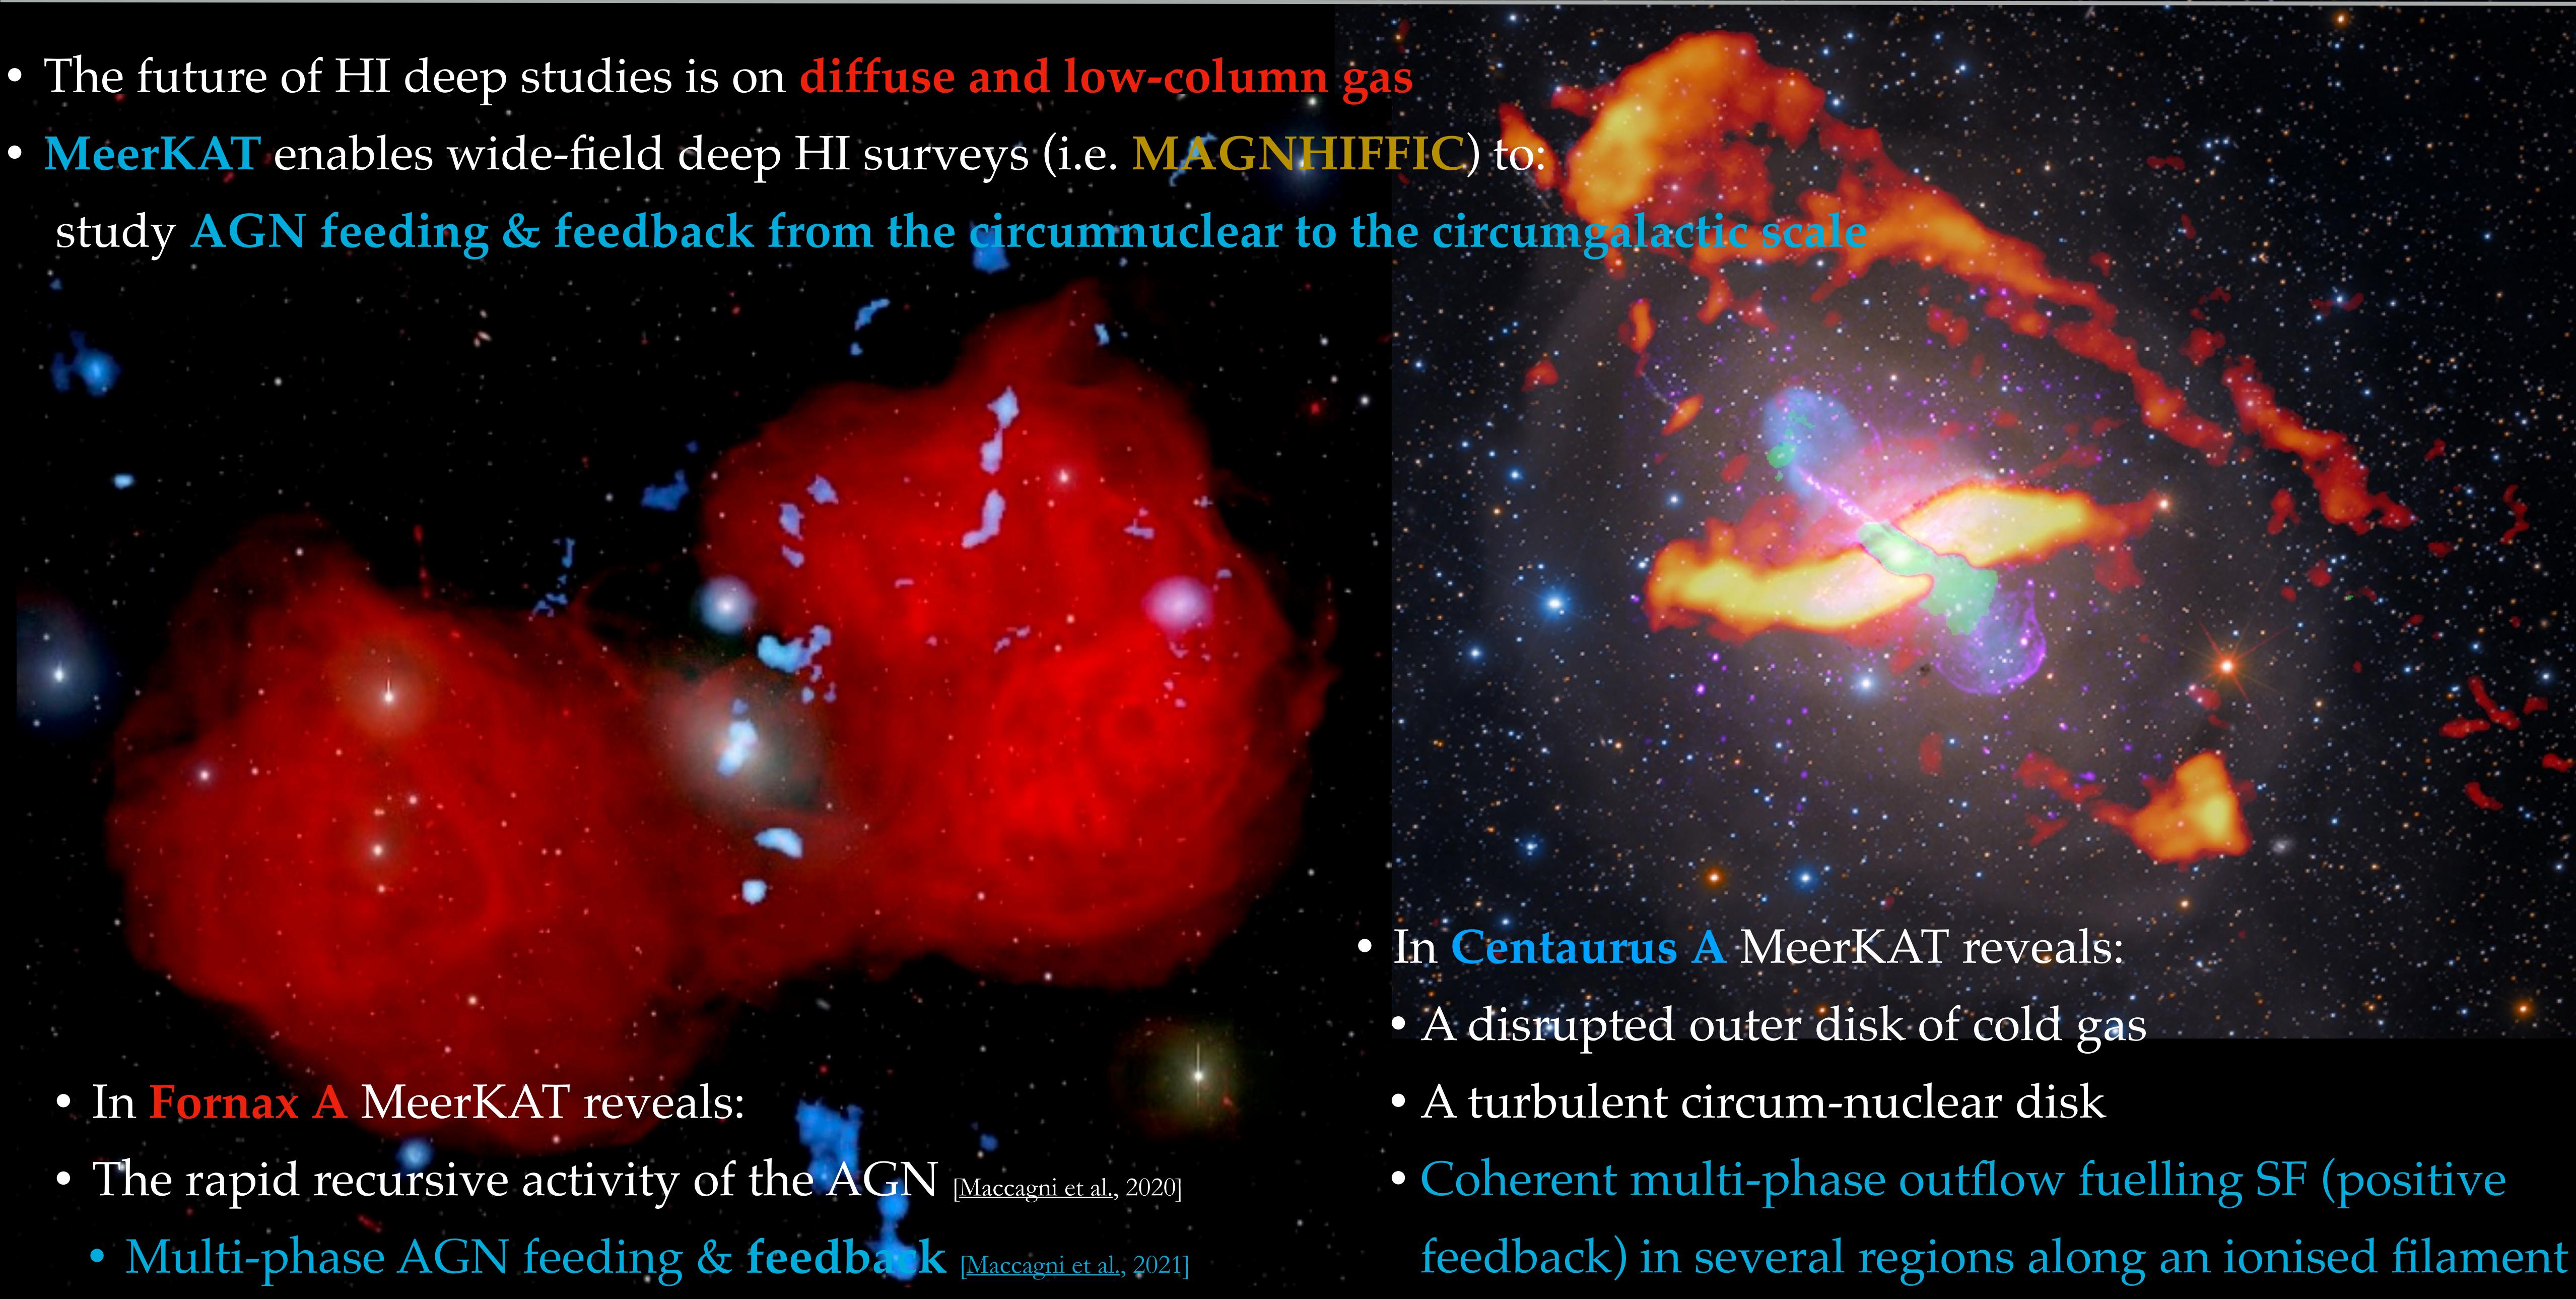

measures the role of turbulence causing condensation of the gas

EW filaments: turbulence may cause cooling and infall

Outflow: very different physical conditions

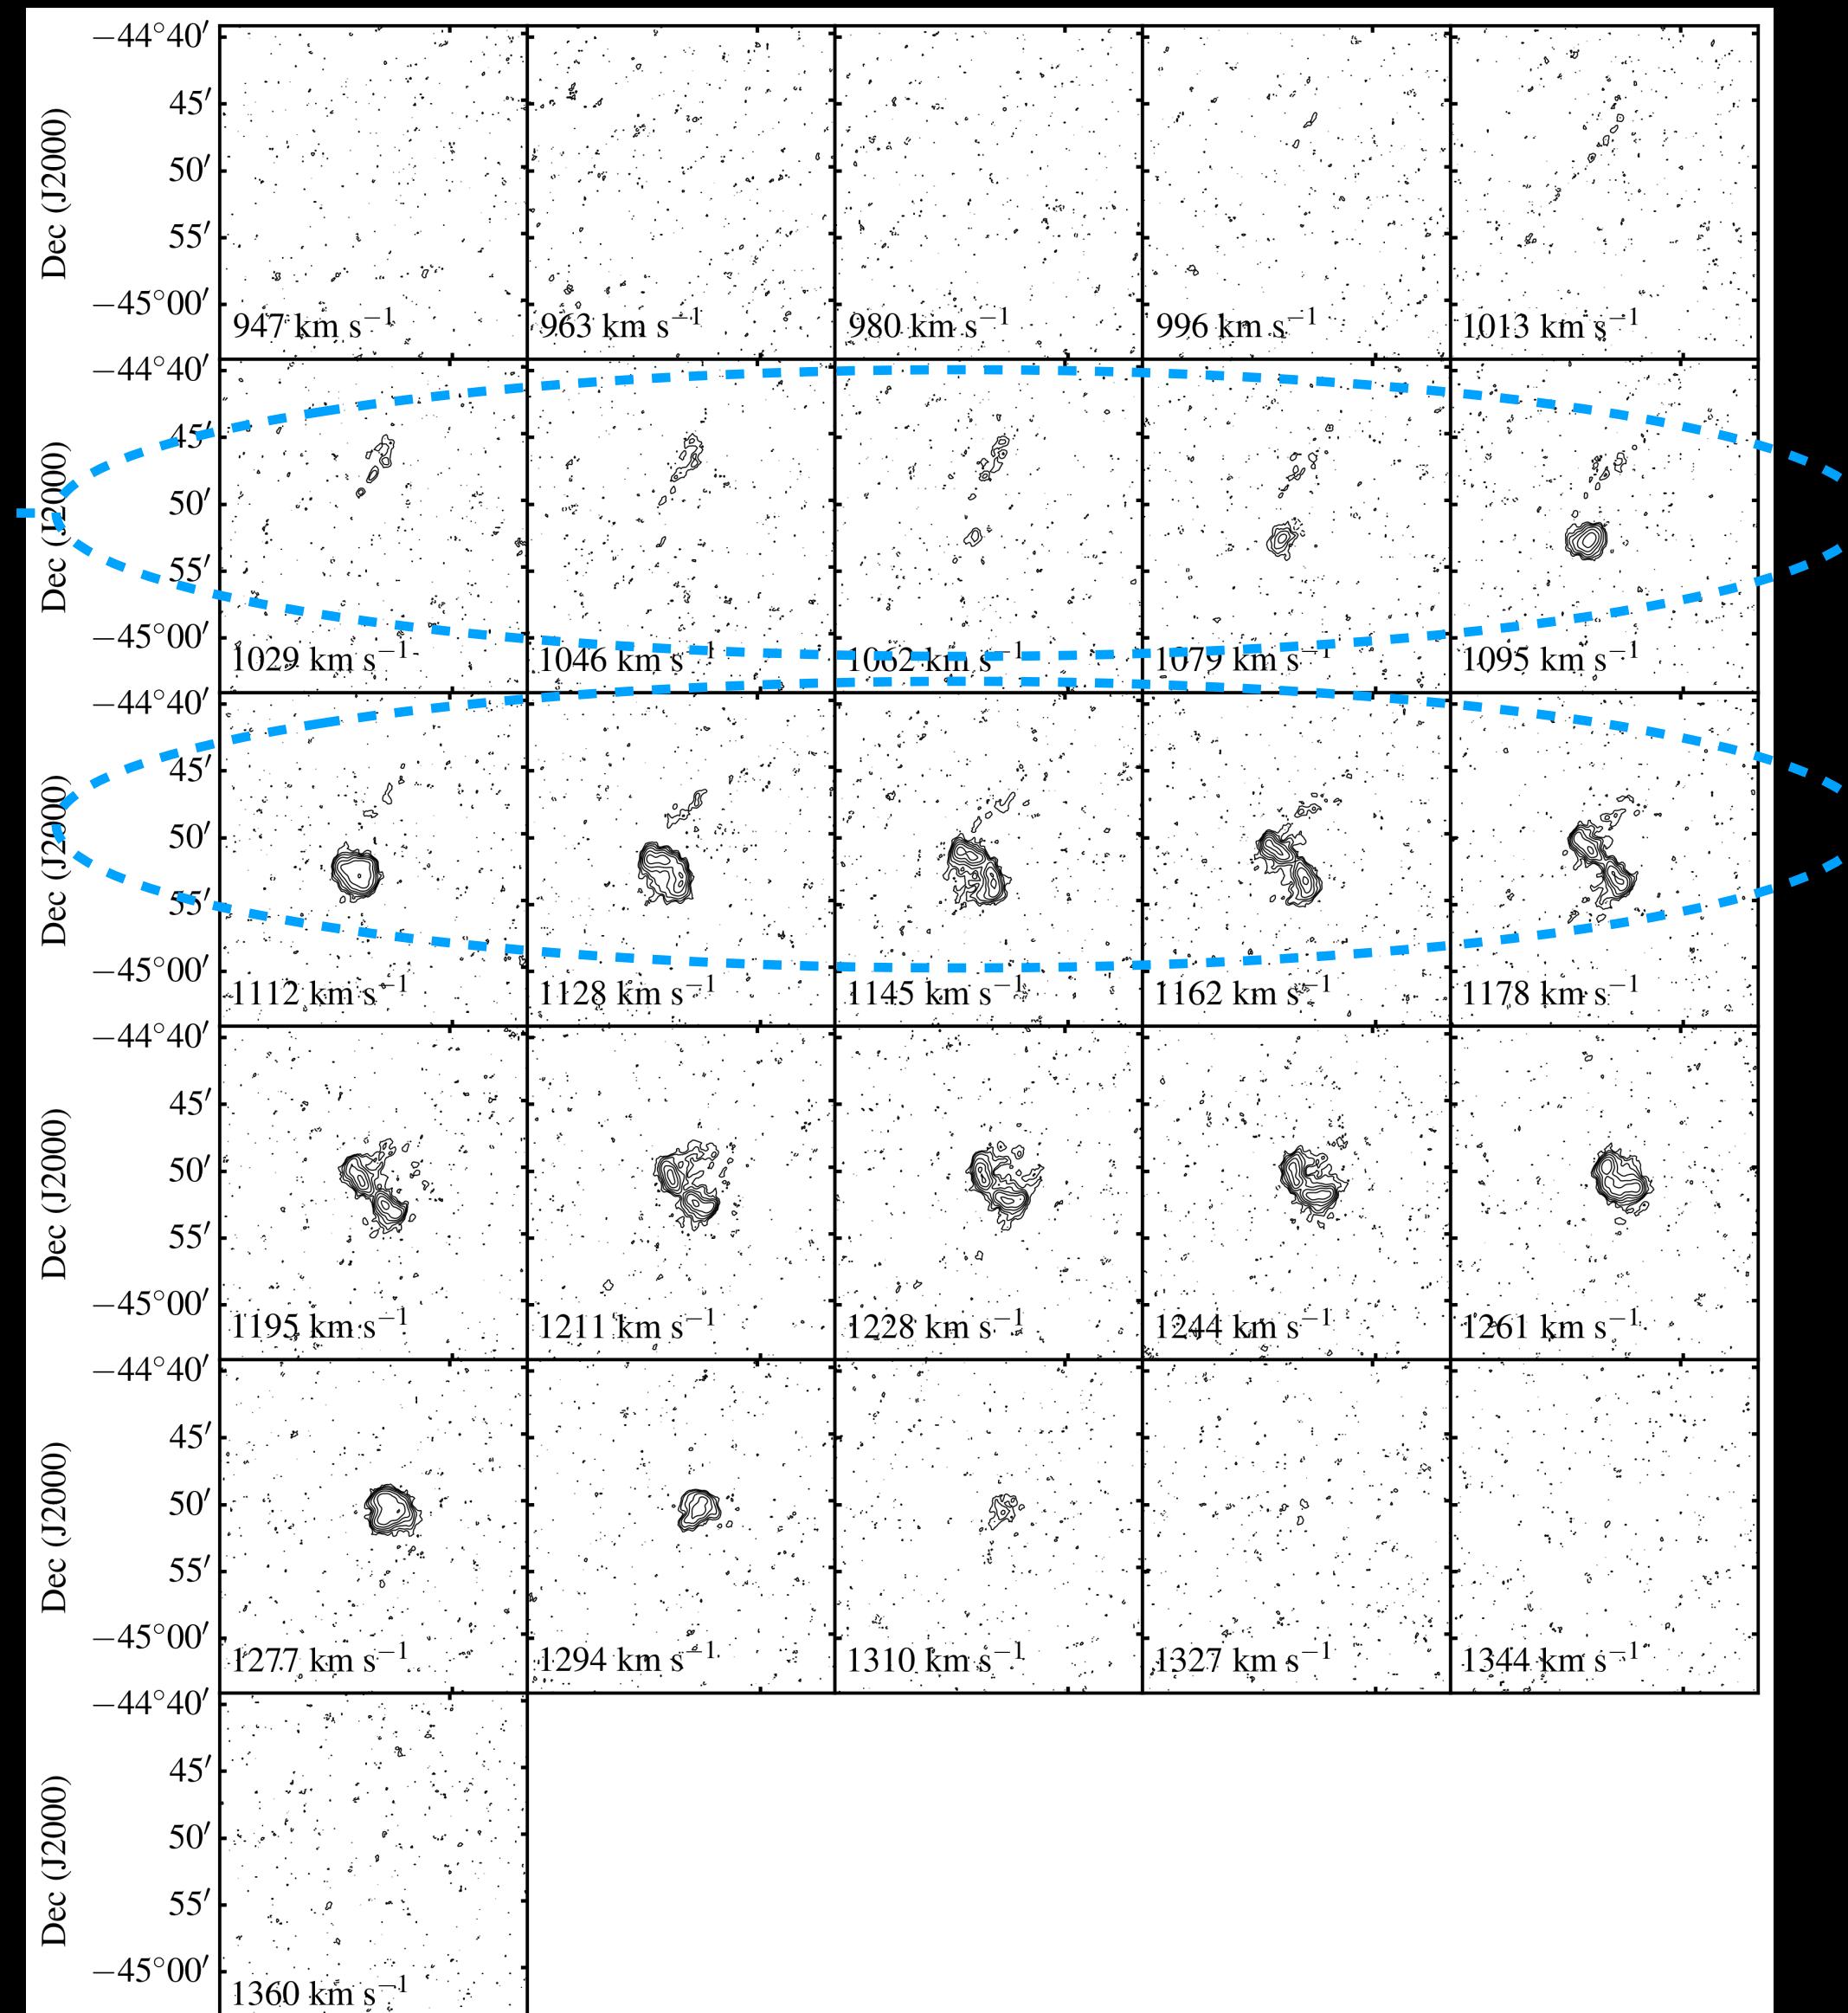

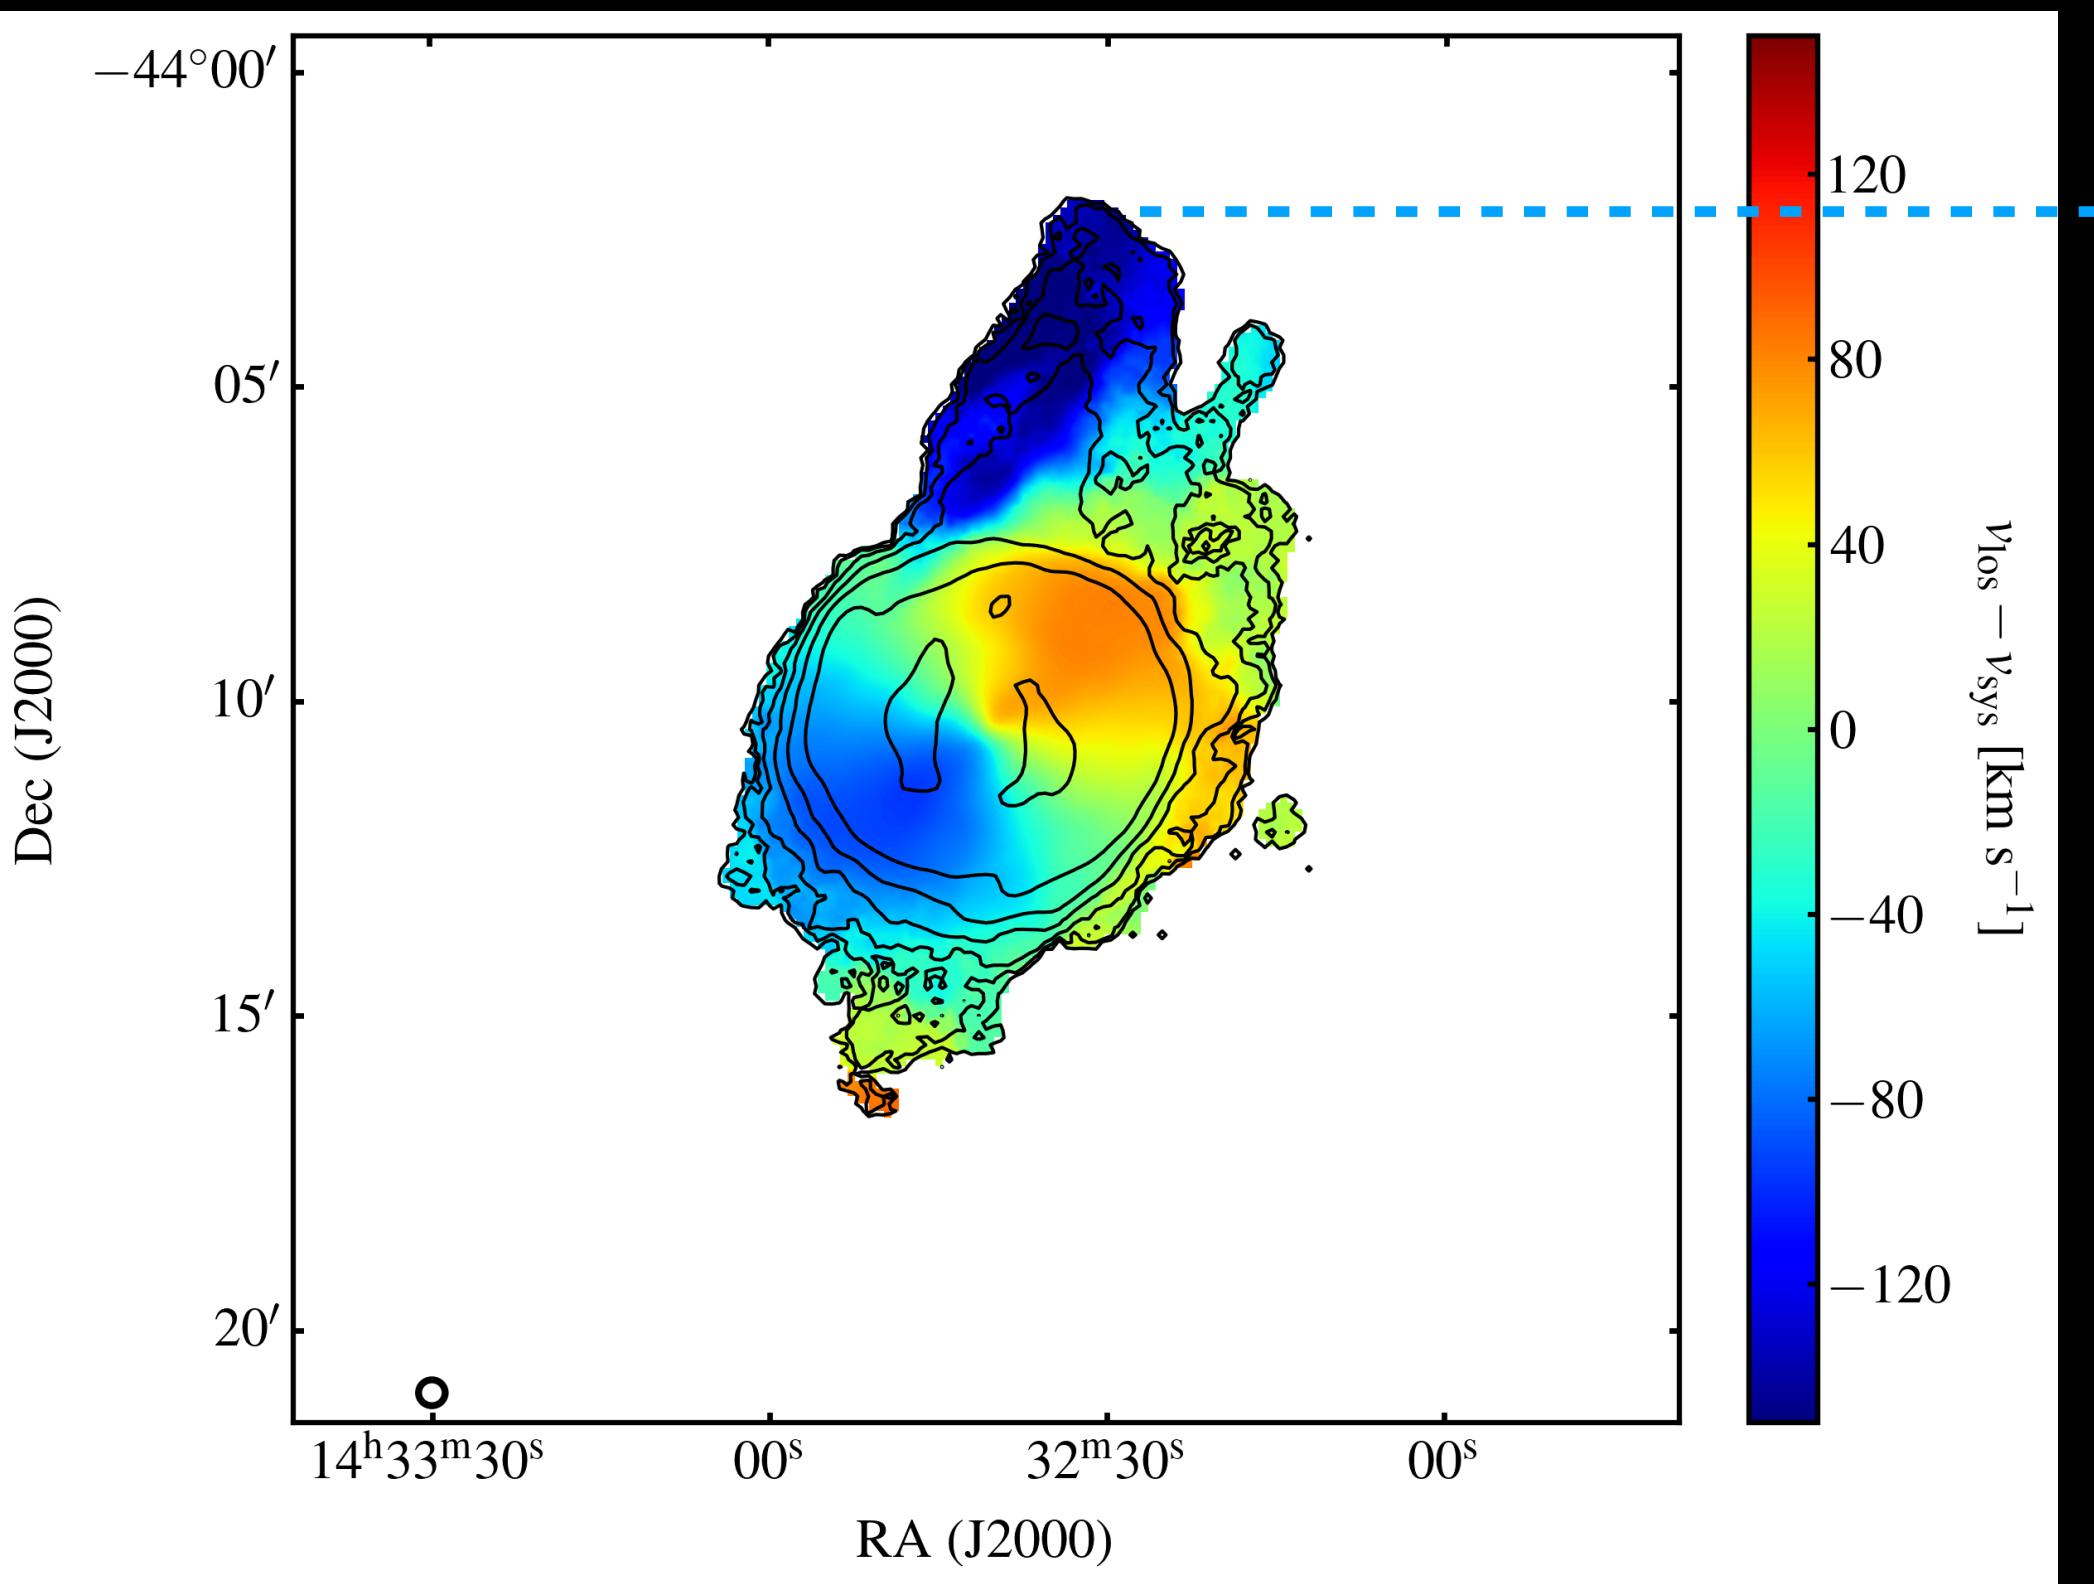

MAGNHIFIC - Conclusions

- The future of HI deep studies is on **diffuse and low-column** gas
- **MeerKAT** enables wide-field deep HI surveys (i.e. **MAGNHIFIC**) to:
study **AGN feeding & feedback from the circumnuclear to the circumgalactic scale**

MAGNHIFIC - NGC5643

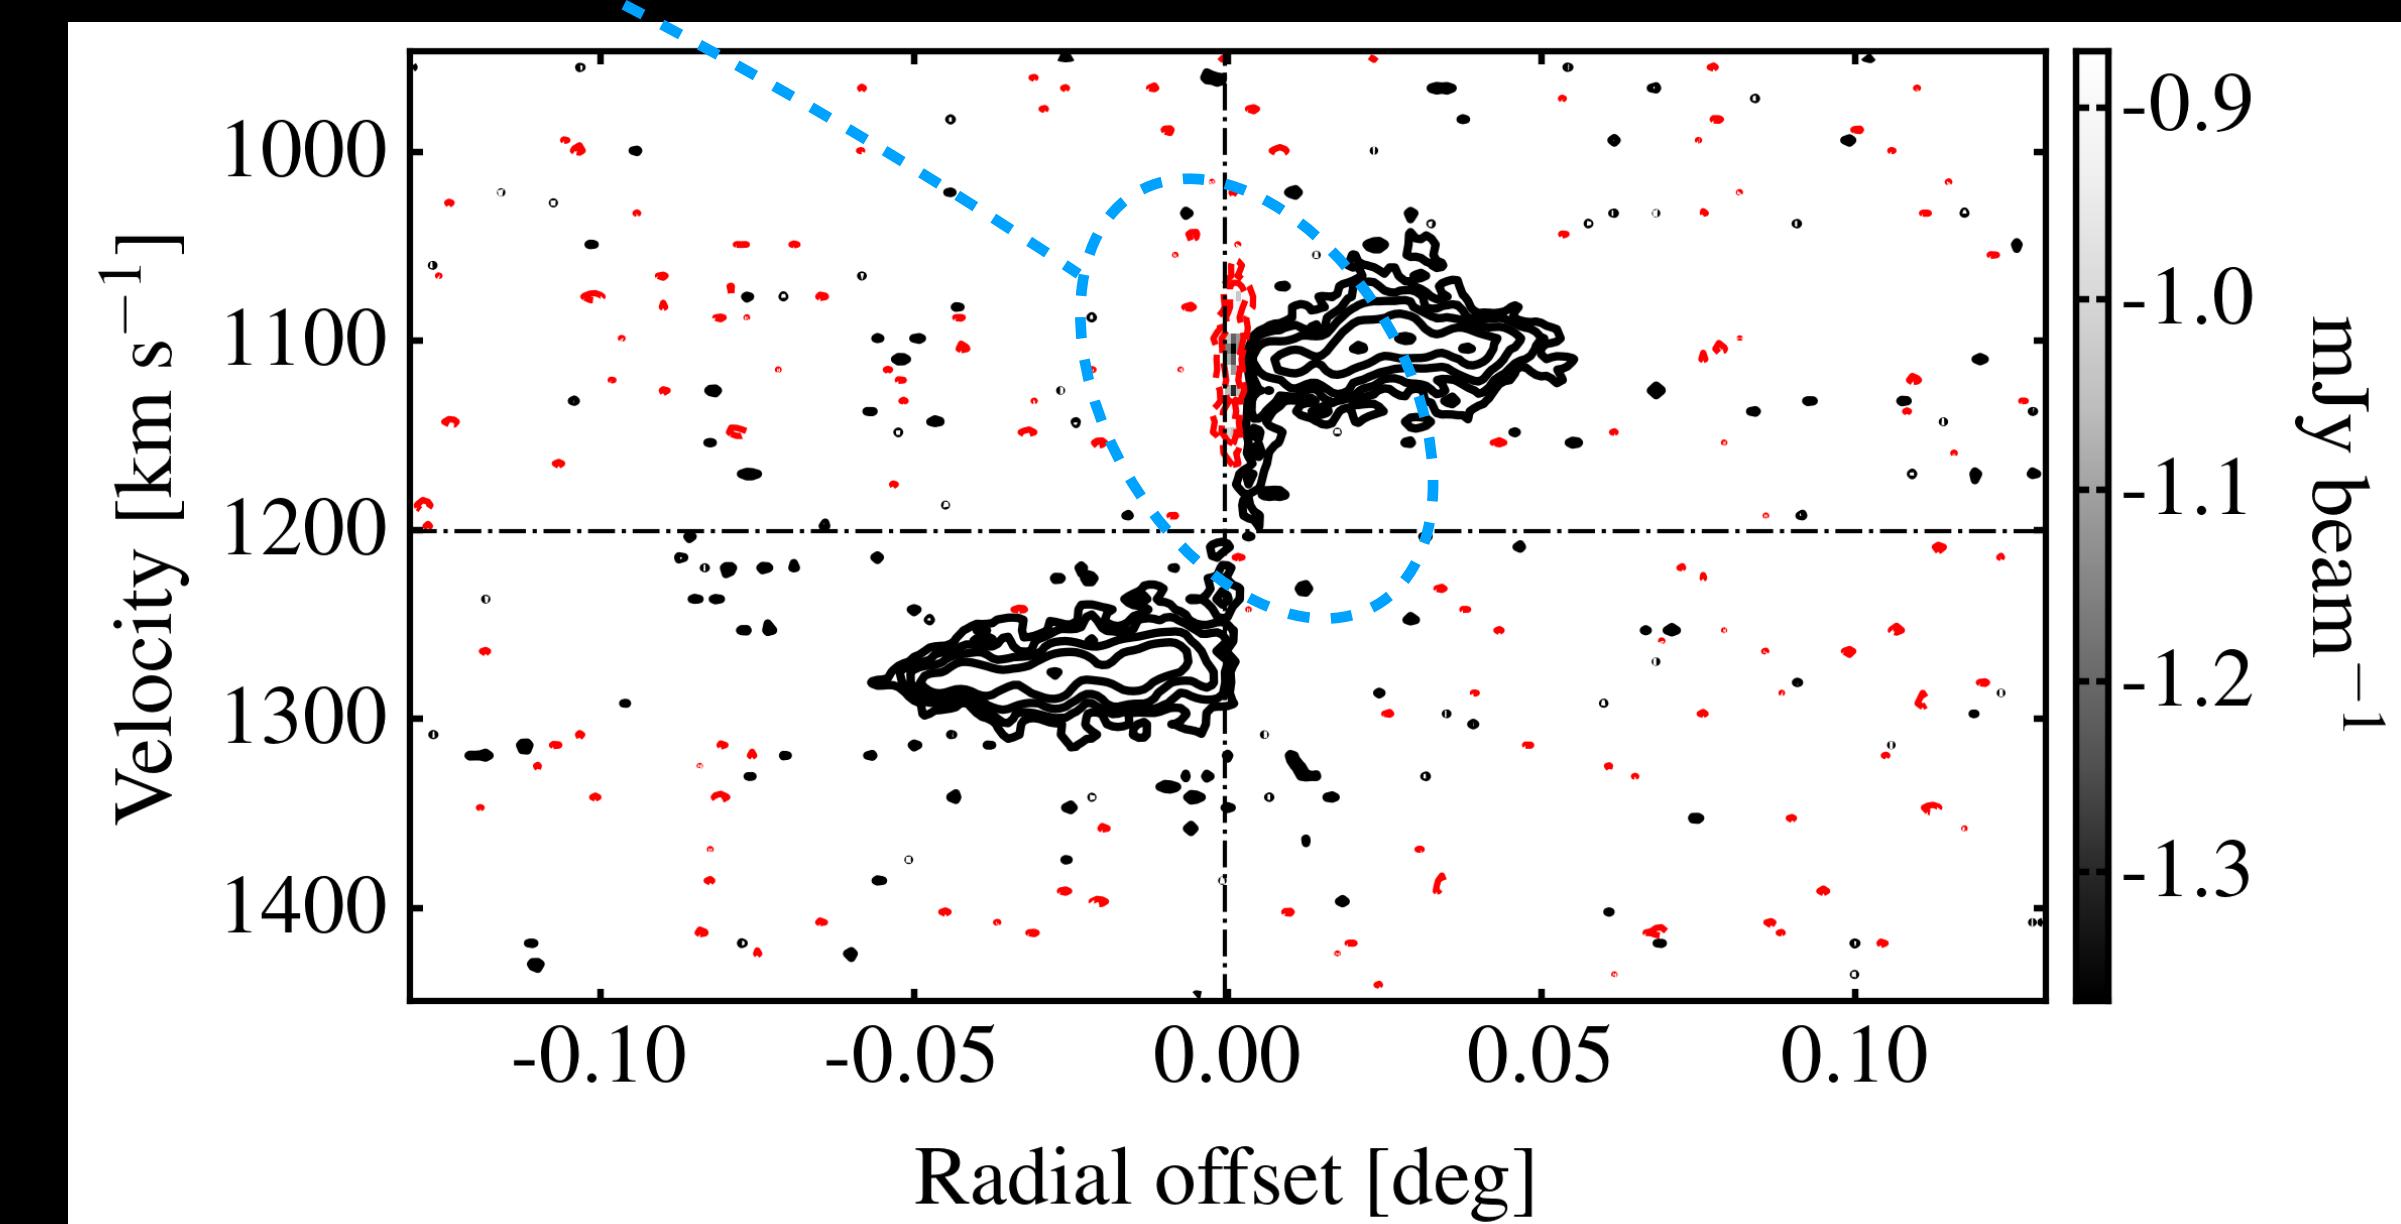

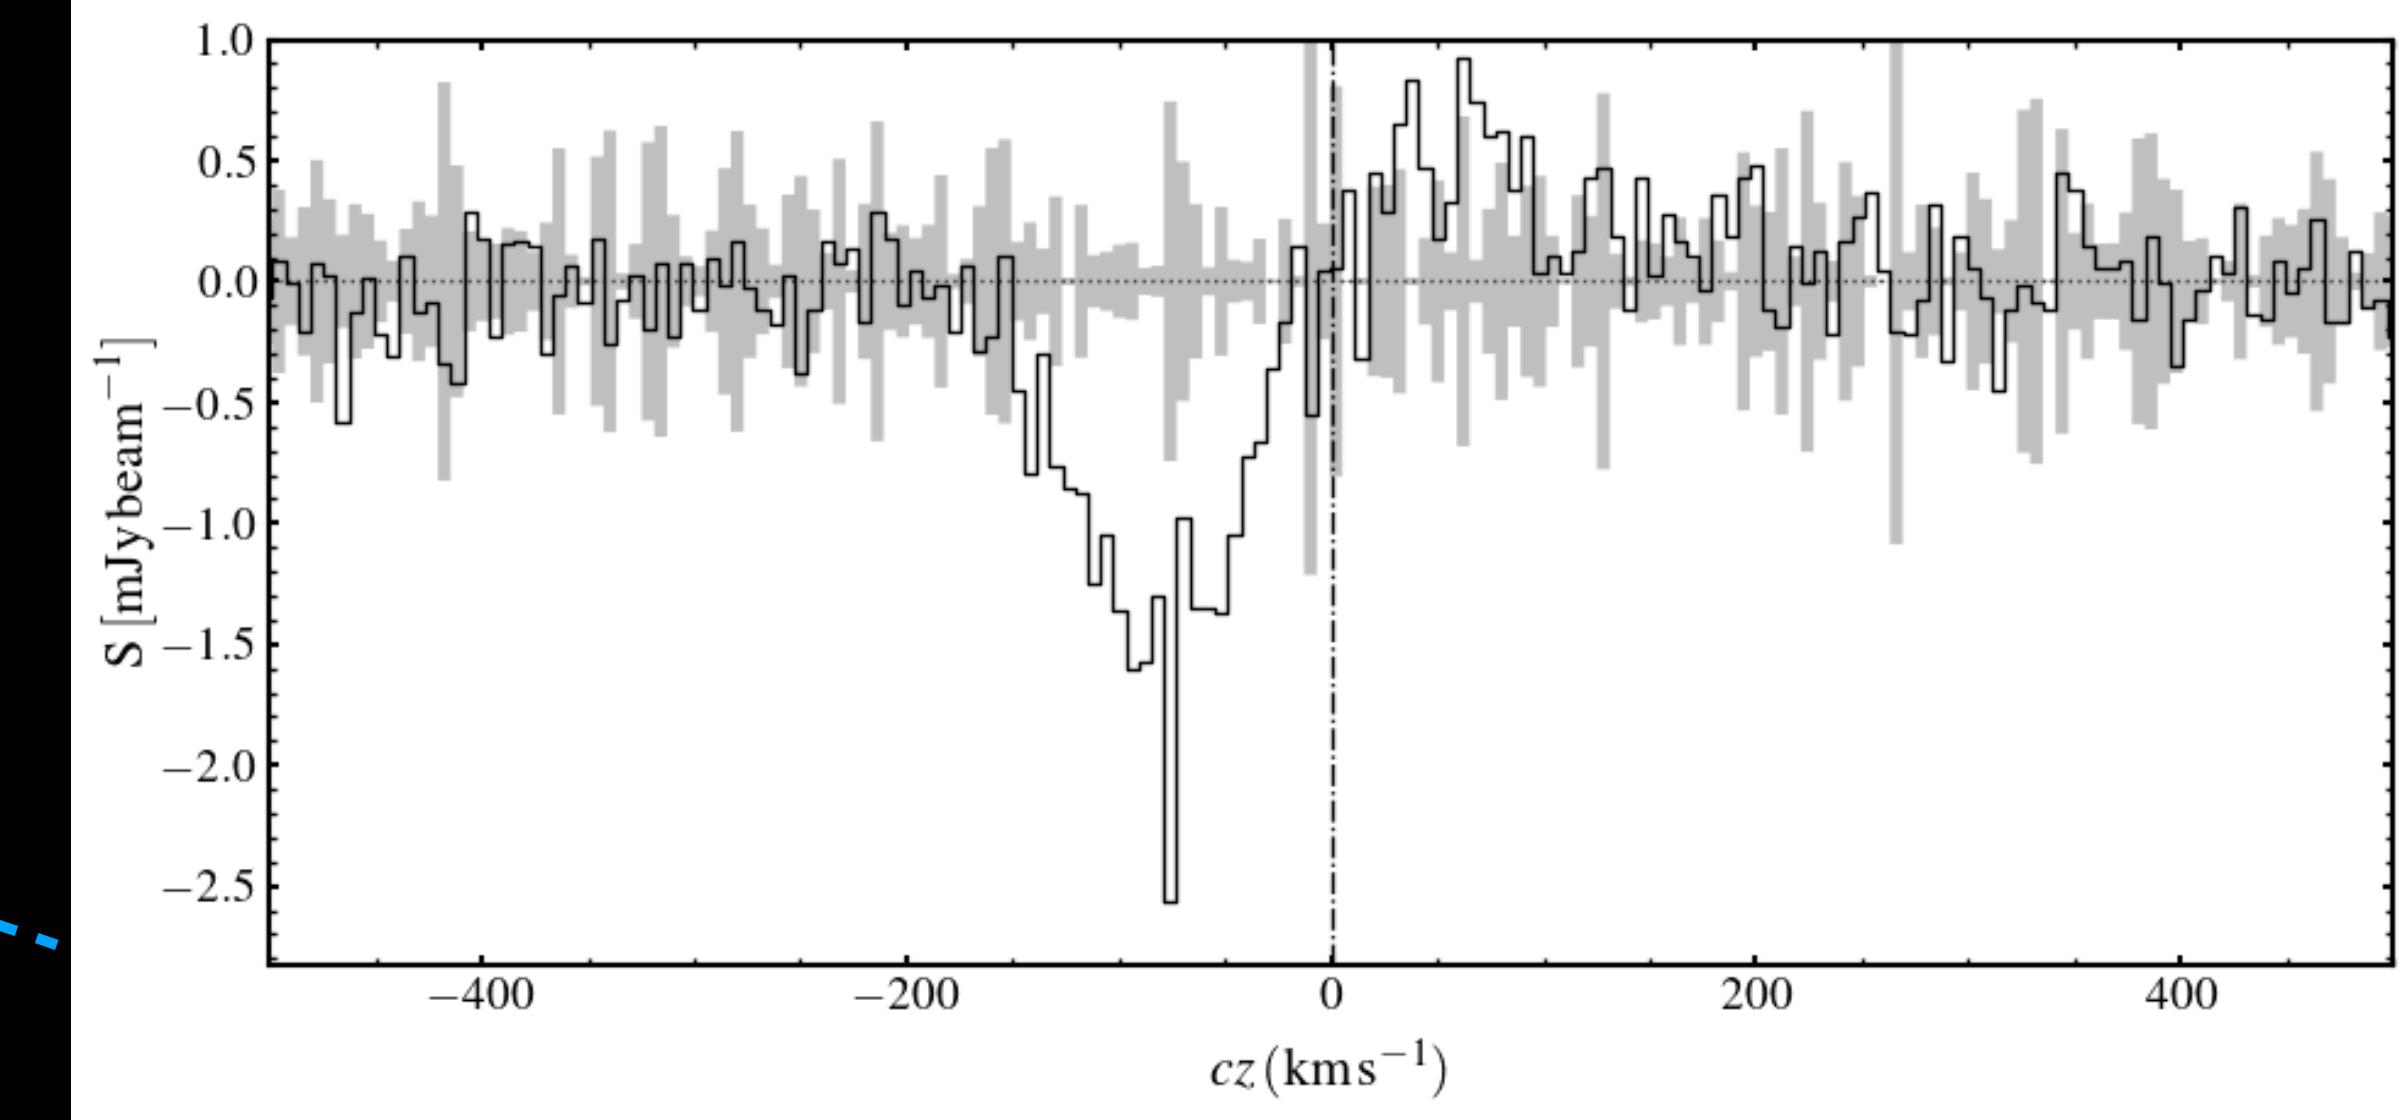

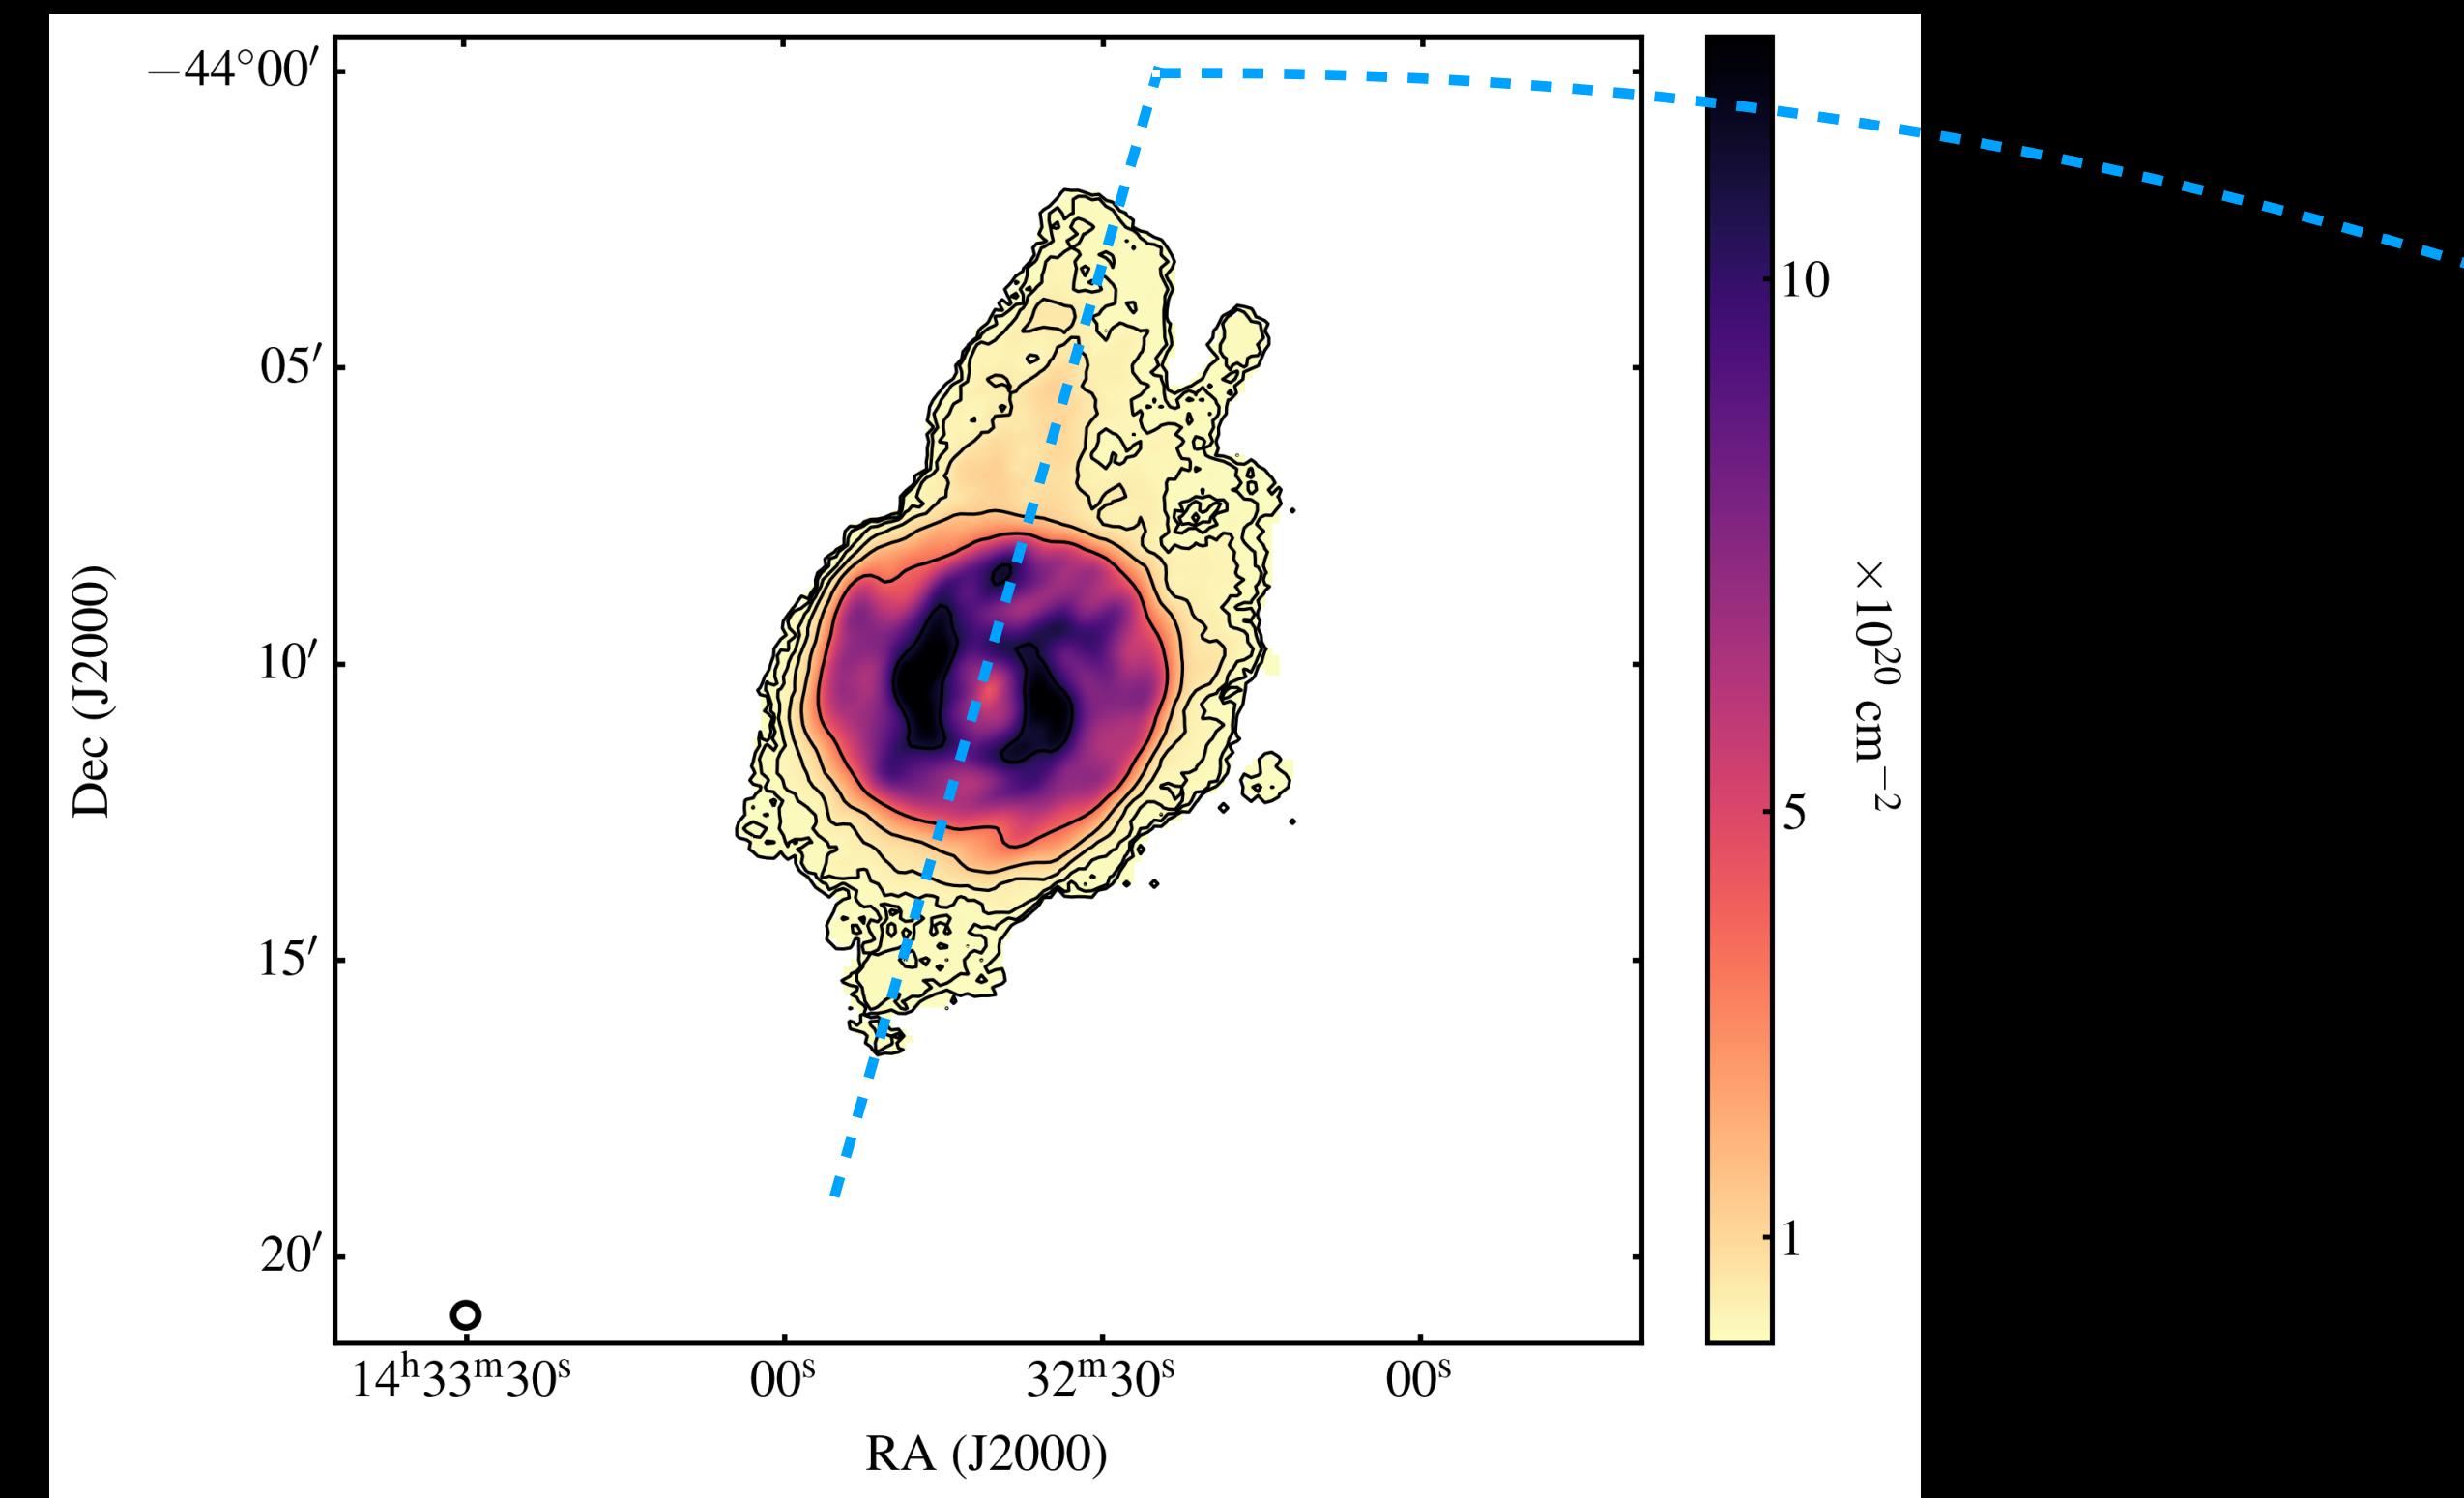

- What is the origin of the northern tail in NGC5643?
- Is gas falling towards the AGN?
- Is NGC5643 undergoing a tidal interaction with a satellite?

-> Answers will be found by Karina Santana @
ASTRON Summer Student program 2023

MAGNHIFIC - NGC5643

- Is HI absorption tracing the neutral atomic counterpart of the ionised and molecular outflow?
- What is the total mass of the outflowing gas? Till where does it extend?

-> Answers will be found by Karina Santana @
ASTRON Summer Student program 2023
